Jöns Jakob Berzelius (1779–1848) not only coined the terms “organic” and “inorganic,” but also invented the system of chemical symbols still used today. He published the first list of accurate atomic weights and proposed the idea that atoms carry an electric charge. He purified or discovered the elements cerium, selenium, silicon, thorium, titanium, and zirconium.

German chemist **Friedrich Wöhler (1800–1882)** began his professional life as a physician and later became a professor of chemistry at the University of Göttingen. Wöhler codiscovered the fact that two different chemicals could have the same molecular formula. He also developed methods of purifying aluminum—at the time, the most expensive metal on Earth—and beryllium.

To stay alive, early humans must have been able to tell the difference between two kinds of materials in their world. “You can live on roots and berries,” they might have said, “but you can’t live on dirt. You can stay warm by burning tree branches, but you can’t burn rocks.”

By the eighteenth century, scientists thought they had grasped the nature of that difference, and in 1807, Jöns Jakob Berzelius gave names to the two kinds of materials. Compounds derived from living organisms were believed to contain an unmeasurable vital force—the essence of life. These he called “organic.” Compounds derived from minerals—those lacking that vital force—were “inorganic.”

Because chemists could not create life in the laboratory, they assumed they could not create compounds with a vital force. With this mind-set, you can imagine how surprised chemists were in 1828 when Friedrich Wöhler produced urea—a compound known to be excreted by mammals—by heating ammonium cyanate, an inorganic mineral.

For the first time, an “organic” compound had been obtained from something other than a living organism and certainly without the aid of any kind of vital force. Clearly, chemists needed a new definition for “organic compounds.” **Organic compounds** are now defined as *compounds that contain carbon*.

Why is an entire branch of chemistry devoted to the study of carbon-containing compounds? We study organic chemistry because just about all of the molecules that

Organic Chemistry (Transition from High School to College) Dipak K. Mandal, 2024-01-25 Organic Chemistry Transition from High School to College is a comprehensive textbook on foundational organic chemistry which aims to provide a seamless link between the higher secondary and the undergraduate level The book has been organized logically to provide an excellent coverage on the structure reactions and synthesis of organic compounds Advanced high school students and beginning undergraduates will find this book invaluable for their academic progression and also for competitive entrance examinations Also students in pharmaceuticals polymer science and medicinal chemistry will find this book very useful Key Features Clear explanations of basic principles of organic chemistry Logical approaches from structure to reactions to synthesis of organic molecules Inclusion of spectroscopy and retrosynthesis as advanced topics Introduction to polymers and biomolecules as special topics Inclusion of in chapter

problems with detailed answers and end of chapter supplementary problems for practice *Advances in Physical Organic Chemistry*, 2012-12-31 *Advances in Physical Organic Chemistry* provides the chemical community with authoritative and critical assessments of the many aspects of physical organic chemistry The field is a rapidly developing one with results and methodologies finding application from biology to solid state physics Reviews the application of quantitative and mathematical methods towards understanding chemical problems Covers organic organometallic bioorganic enzymes and materials topics Carbocation Chemistry George A. Olah, G. K. Surya Prakash, 2004-10-19 A detailed understanding of reactive intermediates is at the heart of chemical transformations and thus of modern organic synthetic chemistry

Carbocations are electron deficient species that are the most important intermediates in organic chemistry This comprehensive review gives practical information on the synthesis mechanisms and spectral studies related to carbocation chemistry A detailed reference for all aspects of carbocation chemistry With numerous classical examples of studies of carbocations to serve as illustrative principles in organic and physical organic chemistry Provides insight into future developments in the field and practical applications

Introduction to Stereochemistry Torsten Schmiernund, 2021-06-07 Conformal diastereomers rotamers tautomers anomers The multitude of terms used in stereochemistry quickly makes this subfield of chemistry confusing In addition there are different nomenclatures and different forms of representation Fischer projection Haworth ring formula Newman projection This essential deals with basic static stereochemistry and gives an overview of the different isomeric forms and nomenclatures It is thus both a help and a reference book This Springer essential is a translation of the original German 1st edition essentials *Einführung in die Stereochemie* by Torsten Schmiernund published by Springer Fachmedien Wiesbaden GmbH part of Springer Nature in 2019 The translation was done with the help of artificial intelligence machine translation by the service DeepL.com A subsequent human revision was done primarily in terms of content so that the book will read stylistically differently from a conventional translation Springer Nature works continuously to further the development of tools for the production of books and on the related technologies to support the authors *The Chemistry of Heterocycles* Vishnu Ji Ram, Arun

Sethi, Mahendra Nath, Ramendra Pratap, 2019-06-01 Heterocycles are ubiquitously present in nature and occupy a unique place in organic chemistry as they are part of the DNA and haemoglobin that make life possible *The Chemistry of Heterocycles* covers an introduction to the topic followed by a chapter on the nomenclature of all classes of isolated fused and polycyclic heterocycles The third chapter delineates the highly strained three membered N O and S containing aromatic and non aromatic heterocycles with one and more than one similar and dissimilar heteroatom The four membered heterocycles are abundantly present in various natural and synthetic products of pharmacological importance This chapter describes the natural abundance synthesis chemical reactivity structural features and their medicinal importance This class of compounds are present as sub structures in penicillin and cytotoxic Taxol Lastly a chapter on the natural abundance

synthesis chemical reactivity and pharmacological importance of 5 membered heterocycles with N O S heteroatom is covered
The chemistry of heterocycles with mixed heteroatom such as N S N O N S etc is also described
