Priestley, 2018-08-14 This work is a historical and philosophical study of the programming work carried out by John von Neumann in the period 1945-8 At the heart of the book is an examination of a manuscript featuring the earliest known surviving example of von Neumann's coding a routine written in 1945 to mesh two sequences of data and intended to be part of a larger program implementing the algorithm now known as mergesort The text of the manuscript itself along with a preliminary document describing the code he used to write this program are reproduced as appendices The program is approached in three chapters describing the historical background to von Neumann's work the significance of the sorting application itself and the development of the EDVAC the machine for which the program was written The subsequent chapters widen the focus again discussing the subsequent evolution of the program and the crucial topic of subroutines before concluding by situating von Neumann's work in a number of wider contexts The book also offers a unifying philosophical interpretation of von Neumann's approach to coding **Technical Abstract Bulletin** Defense Documentation Center (U.S.), 1964 Department of Defense Catalog of Logistics Models ,1990 **The World Politics of Social**

berate contamination of terrestrial and aquatic environments is in most countries still limited to the detection and quantification of the suspected pollutants by chemical analyses. Such an approach is unfortunately hampered by the following constraints: the costs as well as the technical difficulties of analyzing every individual chemical which may be present in the samples and the difficulty of assessing the hazards and risks of environmental contaminations from a set of chemical data. During the last decades the scientific and regulatory community has gradually realized that biological methodologies have to be taken into consideration for an ecologically meaningful assessment of the toxicological hazards of contaminants. Effect evaluations obtained with biological techniques indeed integrate the impact of all the contaminants to which living biota are exposed. Bioassays with selected test species representative for the biological communities of the environments under consideration are now applied more or less regularly to determine toxic and genotoxic effects. Taking into account the species specific and chemical specific character of toxicity to biota, the necessity of a battery of tests approach with species of different trophic levels is currently also generally accepted and implemented. It is clear that a balanced partnership between chemical, biological, toxicological and microbiological analyses is always the best strategy for generating the broadest information base on environmental hazards.
