CLINICAL CASE STUDY

BLAME IT ON THE CHIGGERS

An 85-year-old man arrives one summer morning at the clinic of his Florida retirement community with severe headache, chills, muscle pain, and nausea. He reports that the

symptoms developed quite suddenly. He has had no rash. During the interview the man states that he is a World War II veteran of the battle for Guadalcanal in the South Pacific, a golfer, and an avid bird watcher who spends many hours in the woods near his home. He had not noticed any fleas, ticks, or lice on his body, but he had been almost “eaten alive” by chiggers. His cat had a few fleas, but he had “gotten the little buggers.” He had not been out of the United States in 40 years.

1. What rickettsial diseases might the man have?
2. What are the vectors for these diseases?
3. What diagnostic test(s) might verify the initial diagnosis?
4. Is the man's life in danger?
5. What drug will the physician likely prescribe?

nonmotile and grow and multiply only within vesicles in host cells. Scientists once considered chlamydias to be viruses because of their small size, obligate intracellular lifestyle, and ability to pass through 0.45- μm pores in filters, which were thought to trap all cells. However, chlamydias are cellular and possess DNA, RNA, and functional 70S ribosomes. Each chlamydial cell is surrounded by two membranes, similar to a typical Gram-negative bacterium but without peptidoglycan between the membranes—chlamydias
