

SAFETY AND ELECTRICAL SYSTEMS

1. Some of the PPE that must be worn when entering a substation to do work are:

- (A) **Fire-proof Coveralls**-Coveralls must never be excessively loose-fitting so that it could be entangled by machinery, moving parts etc.
- (B) **Safety Boots**-Boots must be non-skid, insulated and tough enough to prevent against blunt injuries.
- (C) **Safety Helmets**-To prevent head injury from possible danger of overhead falling objects.
- (D) **Safety Goggles, Face shields**-To prevent against eye and face injuries.
- (E) **High Voltage Gloves**-To be used when working on " live" circuits.

2. Four common types of line faults are:

- (A) Ground Faults
- (B) Phase to Phase Faults
- (C) Overheating
- (D) Overvoltage/Undervoltage

SEE ATTACHED DIAGRAMS

3. Three different types of circuit protection devices used in the industry today are:

- (A) **Relays**-A relay is an electrically operated switch. Many relays use an electromagnet to operate a switching mechanism but other operating principles are also used. Generally, a relay isolates the controlled circuit from the controlling circuit with the controlling circuit usually being current and voltage transformers being used as sensing inputs to detect abnormal conditions for the possibility of a fault condition.
- (B) **Current Transformers**-A current transformer is used for measurement of electric currents. When a current in a circuit is too high to directly apply to measuring instruments, a current transformer produces a reduced current accurately proportional to the current in the circuit, which can then be conveniently connected to measuring and recording instruments.
- (C) **Fuses**-A fuse is a type of "sacrificial overcurrent" protection device. Its essential component is a metal wire or strip that melts when too much current flows, which interrupts the circuit in which it is connected. It interrupts excessive current so that further damage by overheating or fire is prevented.

(A 1) Principle operation of:

- (i) **Electromagnetic Relays**-An electromagnetic relay uses the principle of electromechanical energy conversion to implement decisions. They consist of a coil of wire surrounding a soft iron core, an iron yoke which provides a low reluctance path for magnetic flux, a movable iron armature (lever or arm) and one or more sets of contacts. These contacts then rely on the armature, activated by the energized coil to open or close an electrical circuit.
