Concha,Marie-Helene Rio ,Heather Bouman,2024-11-12 Marine ecosystems are open and dissipative systems that rely on an external energy source light for their sustenance The magnitude of the light flux and the spectral quality of the light field which determines colour determine the rate of marine photosynthesis by phytoplankton in the ocean and the types of

phytoplankton communities that flourish in different parts of the ocean and in different seasons Ocean colour determined by the spectral quality of light scattered out of the sea and back into the atmosphere can be monitored using satellite sensors and used to map the distribution of the major phytoplankton pigment chlorophyll a at global scales Remote sensing of ocean colour first realised in 1977 has revolutionised the field of biological oceanography Over the years the quality of satellite products has continued to improve and the range of products available has extended beyond chlorophyll concentration to encompass many variables of interest to biological oceanography and ocean biogeochemistry However it is well recognized that satellite observations have to be integrated with and complemented by field measurements and modelling to obtain the full picture The research topic proposed will cover a range of recent developments in ocean colour remote sensing and allied fields

Volume 2: Marine Ecology Juan M. Molina, Gabriela E. Blasina, 2025-04-17 Marine systems face a multitude of anthropogenic stressors such as climate change recreational and commercial fishing aquaculture practices pollution and coastal urbanization These stressors exert escalating pressure on marine ecosystems leading to noticeable changes in habitat conditions as well as alterations in the abundance and diversity of their communities Understanding the impacts of these stressors proves challenging due to their interactions with various factors such as species richness environmental fluctuations system openness stressor tolerance and the occurrence rate and intensity of each stressor Therefore a comprehensive analysis of the entire ecosystem is crucial It is essential to consider the unique characteristics of each marine environment when assessing the cumulative stress that affects them This book provides insights into the functioning of marine ecosystems and their responses to both natural and human induced drivers within the framework of sustainable marine resource utilization This book will make a valuable contribution to the scientific community serving as a resource to inform decision makers and the general public about the current state of knowledge regarding the

marine environment and the human footprints on our seas
