Observing Human Traits Lab

Background: Physical traits are observable characteristics that are determined by genes. Genes are specific segments of DNA located on chromosomes that code for a particular trait. Most genes have two or more variations called alleles. Some alleles are dominant over others and dominant alleles will be expressed (an organism's phenotype or physical appearance) over recessive alleles. Recessive alleles may be present in an organism but expression is masked in the presence of a dominant allele for the same gene. Recessive traits are only expressed when there are two recessive alleles present in the genotype (DNA code).

Keep in mind that it's not always quite this simple. There are other factors that influence expression, and most traits have several genes that influence them. This is an introduction to dominant and recessive traits. Let's get started!

Being Human Ron Broglio, Frederick Young, 2017-10-02 Technology and animals often serve as the boundaries by which we define the human In this issue contributors explore these categories as necessary supplements or as porous membranes which disturb the scaffolding of how the human is constructed A lingering question throughout is whether we have ever been human or if such a category is a non localizable ideal or perhaps a misnomer In this collection of essays internationally known theorists muddle the categorical boundaries such that animals and technologies become necessary components rather than limits for what it means to be human They examine a range of subjects including apophatic animality critical media objects to think with biosemiotic insect resonances the monstrous and horrific which dislodges our cultural animals and the problem of thinking of animality as stupidity Novels films digital objects scientific laboratories philosophical texts animals on the road and in the fields serve as sites for inquiry The result of these investigations is the spectral possibility that we are not the humans we make ourselves out to be This book was originally published as a special issue of *Angelaki*

Briggs Phillips, 1961 A study of microbiological safety in 102 laboratories in 18 countries shows that methods used to control laboratory accidents and illnesses vary widely and that only a few laboratories are reasonably successful Considering the various available approaches

for improving safety in the handling of infectious microorganisms there is need for critical experimental evaluation to determine under what conditions improvements are or are not desirable and the effectiveness of those changes made Of special interest to the Department of the Army would be the ability of laboratories throughout the free world to operate safely with infectious microorganisms under non peacetime conditions Through continued analysis of the world wide status of microbiological safety and through improved communications with foreign laboratories the Biological Laboratories could gather information applicable in its safety program and make a significant contribution to the ability of other laboratories to safely carry out biological defense programs Author *The Anthropology of Childhood* David F.
