

The following program demonstrates the use of #define and const –

```
#include<iostream>
using namespace std;
#define PI 3.142
const int MAX=5;
int main ()
{
    float radius, area;
    cout<<"Enter the radius :";
    cin>> radius;
    area=PI*radius*radius;
    cout<< "Area of the circle = "<<area <<"\n";
    cout<<"constant max value is: "<<MAX<<endl;
    // PI=3; //Invalid
    // MAX=10; //error: assignment of read-only variable 'MAX'
}
```

In the above program the statement

```
area = PI * radius * radius;
```

is translated by the preprocessor as

```
area = 3.142 * radius * radius;
```

and calculated result is stored in the variable 'area' which is displayed in the next statement.

MAX variable contains the constant value 5 and same is displayed.

- c) **The main keyword:** It is explained earlier in the user-defined data type section.

### Operators

An operator is a symbol that tells the compiler to perform specific mathematical or logical manipulations. All C operators are valid in C++. The detailed description is provided in separate document for C operators for ease of reading. All the codes should be experimented by students using C++ syntax. Following operators other than >> and << are available in C++:

::	Scope resolution operator
::*	Pointer-to-member declarator
->*	Pointer-to-member operator
.*	Pointer-to-member operator
delete	Memory release operator
endl	Line feed operator
new	Memory allocation operator
setw	Field width operator

### Typcasting

Typcasting is the concept of converting the value of one type into another type. For example, you might have a float that you need to use in a function that requires an integer.

- **Implicit conversion:** Almost every compiler makes use of what is called automatic typecasting. It automatically converts one type into another type. If the compiler converts a type it will normally give a warning. For example this warning: conversion from "double" to "int", possible loss of data. The problem with this is, that you get a warning (normally you
