

Physical vs. Chemical Properties

A **physical property** is observed with the senses and can be determined without changing the object. Examples: color, shape, mass, length and more are all characteristics of physical properties.

A **chemical property** indicates how a substance reacts with something else. The simplest example is flammability, a chemical property that is observed by burning. For example, the ability of wood to burn is a chemical property. The wood is converted into energy, and the original wood is destroyed. In some cases, even the number of different substances with a different formula, $2H_2 + O_2 \rightarrow 2H_2O$.

Identify the following properties as either chemical or physical by putting a check in the appropriate column.
