Plant Response to Gold Nanoparticles Azamal Husen, 2024-12-01 In this book overall plant and soil system are examined exclusively in terms of gold nanoparticles Au NPs exposure Au NPs influence plant growth and yield performance They also affect plant and soil system interactions Au NPs responses are primarily depends on the concentration plant species or cultivars exposure time shape and size of NPs Investigation have shown that the lower concentrations of Au NPs increase seed germination beneficial biochemical components rate of photosynthesis and overall growth however at higher concentrations all these responses are declined in different plant species At higher concentration Au NPs induce stress in plant create phytotoxicity and produce reactive oxygen species which leads to the disruption of cellular metabolism Further at higher concentration Au NPs hampered the physico chemical process of plant and soil system Moreover the molecular and physiological performance showed that the exposure of Au NPs resulted in oxidative stress and induced antioxidative and defense responses The energy production related to metabolic pathways were also influenced by Au NPs exposure Au NPs exposure accelerated the number of chromosomal aberrations micronuclei and decreased the mitotic index in plant root tip cells Proteomic study has shown that the exposure Au NPs resulted in an accumulation of protein precursors indicative of the dissipation of a proton motive force Au ions were noticed in roots and shoots while Au NPs were absorbed only in the plant root tissues Au NPs exposure also influence flowering process and seed germination Beside the terrestrial plants these particles have also influenced the growth of some wetland and aquatic plants It was also noticed that the addition of Au NPs into the culture medium had also influence the in vitro development and multiplication of plants Studies have begun to examine how arbuscular mycorrhizal fungi might affect the uptake of specific nanoparticles include Au and how these particles might influence the plant mycorrhizal relationships The impact of Au NPs on the size and structure of microbial communities in soil and soil enzymatic activities for glucosidase urease alkaline phosphatase and dehydrogenase has been examined In the present book environmental safety and ethical issues related to use of Au NPs in plant and soil system has been also explored Overall this book is provide an up to date most important and selected information associated with the plant response to Au NPs This book will be a good resource for upper level students faculty scientists and researchers working specially on plant biology plant nanobiotechnology plant biochemistry plant microbiology agricultural and other allied subjects and or science Environmental Pollution and Plant Responses Shashi Bhushan Agrawal, Madhoolika Agrawal, 2023-01-30 Comprehensive and global in scope Environmental Pollution and Plant Responses provides an analysis of the research on the factors contributing to the deteriorating environmental quality and its effect on plant performance The issues include environmental pollution and global climate change response patterns of plants at different levels mechanisms of interaction tolerance strategies and future research prospects The author evaluates trends and gives management strategies for abating the problem This volume highlights the complexities of environmental problems and the affect of

pollution on every level of the ecosystem Plants' Responses to Novel Environmental Pressures Alessio Fini, Massimiliano Tattini, Raquel Esteban, 2018-02-01 Plants have been exposed to multiple environmental stressors on long term seasonal and short term daily basis since their appearance on land However the frequency and the intensity of stress events have increased much during the last three decades because of climate change Plants have developed however a multiplicity of modular and highly integrated strategies to cope with challenges imposed by novel usually harsher environments These strategies include migration acclimation and adaptation Twelve articles in this research topic exactly focus on the relative significance of these response mechanisms for the successful acclimation of plants to a wide range of novel environmental pressures Four articles additionally explore how plants respond to severe stress conditions resulting from the concurrent action of multiple stressors Ten articles mostly examine how morpho anatomical physiological and biochemical related traits integrate when plants suffer from novel threats such as solid gaseous and electromagnetic pollutants Suitable physiological indicators for developing conservation strategies are described in the last two works This research topic highlights that bottom up as well as top down approaches will be necessary to develop in near future in the study of plants responses to environmental pressures Plant Responses to Hypoxia Elena Loreti, Gustavo Striker, 2021-03-02 Molecular oxygen deficiency leads to altered cellular metabolism and can dramatically reduce crop productivity Nearly all crops are negatively affected by a lack of oxygen hypoxia due to adverse environmental conditions such as excessive rain and soil waterlogging Extensive efforts to fully understand how plants sense oxygen deficiency and their ability to respond using different strategies are crucial to increase hypoxia tolerance Progress in our understanding has been significant in recent years This topic certainly deserves more attention from the academic community therefore we have compiled a series of articles reflecting the advancements made thus far **Induced plant responses to microbes and insects** Corné M. J. Pieterse, Marcel Dicke, Saskia C. M. Van Wees, Erik H. Poelman, 2014-04-14 Plants are members of complex communities and interact both with antagonists and beneficial organisms An important question in plant defense signaling research is how plants integrate signals induced by pathogens insect herbivores and beneficial microbes into the most appropriate adaptive response Molecular and genomic tools are now being used to uncover the complexity of the induced defense signaling networks that have evolved during the arms races between plants and the other organisms with which they intimately interact To understand the functioning of the complex defense signaling network in nature molecular biologists and ecologists have joined forces to place molecular mechanisms of induced plant defenses in an ecological perspective In this Research Topic we aim to provide an on line open access snapshot of the current state of the art of the field of induced plant responses to microbes and insects with a special focus on the translation of molecular mechanisms to ecology and vice versa *Sports Fields* James C. Plant cell wall in pathogenesis, parasitism and symbiosis Vincenzo

Lionetti, Jean-Pierre Metraux, 2015-03-13 The cell wall is a complex structure mainly composed of cellulose microfibrils embedded in a cohesive hemicellulose and pectin matrix Cell wall structural proteins enzymes and their inhibitors are also essential components of plant cell walls They are involved in the cross link of cell wall polysaccharides wall structure and the perception and signaling of defense related elicitors at the cell surface In the outer part of the epidermal cells the polysaccharides are coated by the cuticle consisting of hydrophobic cutin suberin and wax layers Lignin a macromolecule composed of highly cross linked phenolic molecules is a major component of the secondary cell wall The cell wall is the first cell structure on which interactions between plants and a wide range of other organisms including insects nematodes pathogenic or symbiotic micro organisms take place It not only represents a barrier that limits access to the cellular contents that provide a rich nutrient source for pathogens but serves as a source of elicitors of plant defense responses released upon partial enzymatic degradation of wall polysaccharides during infection Modification of the plant cell wall can also occur at the level of plasmodesmata during virus infection as well as during abiotic stresses The fine structure and composition of the plant cell wall as well as the regulation of its biosynthesis can thus strongly influence resistance and susceptibility to pathogens This Research Topic provides novel insights and detailed overviews on the dynamics of the plant cell wall in plant

defence parasitism and symbiosis and describes experimental approaches to study plant cell wall modifications occurring during interaction of plants with different organisms *Frontiers of Sulfur Metabolism in Plant Growth, Development, and Stress Response* Stanislav Kopriva, Dibyendu Talukdar, Hideki Takahashi, Rüdiger Hell, Agnieszka Sirko, Stanislaus F. D' Souza, Tulika Talukdar, 2016-09-07 Growing plants have a constitutive demand for sulfur to synthesize proteins sulfolipids and other essential sulfur containing molecules for growth and development The uptake and subsequent distribution of sulfate is regulated in response to demand and environmental cues The importance of sulfate for plant growth and vigor and hence crop yield and nutritional quality for human and animal diets has been clearly recognized The acquisition of sulfur by plants however has become an increasingly important concern for the agriculture due to the decreasing S emissions from industrial sources and the consequent limitation of inputs from atmospheric deposition Molecular characterization involving transcriptomics proteomics and metabolomics in *Arabidopsis thaliana* as well as in major crops revealed that sulfate uptake distribution and assimilation are finely regulated depending on sulfur status and demand and that these regulatory networks are integrated with cell cycle photosynthesis carbohydrate metabolism hormonal signaling uptake and assimilation of other nutrients etc to enable plant growth development and reproduction even under different biotic and abiotic stresses This knowledge can be used to underpin approaches to enhance plant growth and nutritional quality of major food crops around the world Although considerable progress has been made regarding the central role of sulfur metabolism in plant growth development and stress response several frontiers need to be explored to reveal the mechanisms of the cross talk between sulfur metabolism and these processes In this research topic the knowledge on plant sulfur metabolism is reviewed and updated Focus is put not only on molecular mechanisms of control of sulfur metabolism but also on its integration with other vital metabolic events The topic covers 4 major areas of sulfur research sulfate uptake assimilation and metabolism regulation and role in stress response We hope that the topic will promote interaction between researchers with different expertise and thus contribute to a more integrative approach to study sulfur metabolism in plants **NTSE-NMMS/**

Plant-Environment Interactions František Baluška, 2009-03-03 Our image of plants is changing dramatically away from passive entities merely subject to environmental forces and organisms that are designed solely for the accumulation of photosynthate. Plants are revealing themselves to be dynamic and highly sensitive organisms that actively and competitively forage for limited resources both above and below ground; organisms that accurately gauge their circumstances; use sophisticated cost-benefit analysis; and take clear actions to mitigate and control diverse environmental threats. Moreover, plants are also capable of complex recognition of self and non-self and are territorial in behavior. They are as sophisticated in behavior as animals, but their potential has been masked because it operates on time scales many orders of magnitude less than those of animals. Plants are sessile organisms. As such, the only alternative to a rapidly changing environment is rapid adaptation. This book will focus on all these new and exciting aspects of plant biology.
