Applications of Rehabilitation Engineering Technologies for the Intervention of Neural and Motor Impairment Post Stroke Dong Feng Huang, Guanglin Li, 2020-01-10 Stroke is the leading cause of disability worldwide. Stroke survivors often have motor impairments which contribute to upper limb dysfunctions, reduced balance, postural control, and reduced mobility and proprioception. These physical symptoms lead to reduced social participation and poor quality of life. Over the past ten years, there has been an enormous focus on the use of virtual reality (VR) and other technologies to improve clinical outcomes for people with stroke. These technologies include large-scale bespoke manufactured immersive virtual reality systems or home-based rehabilitation devices such as the commercially available device Nintendo Wii and Microsoft Xbox. The clinical efficacy of these rehabilitation technologies has been studied extensively, but our understanding of the underlying mechanism of recovery induced by these technologies is poor. There are two aspects of recovery that must be considered. One is the learning compensation strategies where patients acquire new skills to improve functional abilities. The other aspect is the neuroplasticity mechanism which leads to cortical map reorganisation. The patient is able to reuse the same body segments in the same way as they did before the stroke. Published studies generally reported improvement in upper limb function, lower limb function, balance, and gait. This leads to the uncertainty whether these technologies are effective in promoting recovery at neural level or functional level. With the advance in technology, monitoring techniques such as neural imaging, motion analysis

and EMGs devices have broad applications in the understanding of neural recovery post stroke Studies that utilize functional outcome measures or observational design may be more effective in identifying functional recovery A combination of the two designs may be helpful to provide new insights on the recovery mechanism induced by rehabilitation devices
