Source: Science 10 Learner's Material

Figure 2.2 shows the parts of the female reproductive system. The female reproductive system performs female sexual and child-bearing functions. It consists of a pair of gonads or the ovaries, fallopian tube or oviduct, the uterus, the vagina, and the external genitalia or the vulva. Each organ performs related functions such as to produce eggs, to produce hormones, to receive the sperm cells that will fertilize the eggs, and to provide for the development of the embryo.

The following describes the function of each part:

Part	Function
Ovary	produces egg cells
Fallopian Tube or Oviduct	The passageway of eggs from the ovary to the uterus and the same place where the egg is fertilized
Uterus	develops the fertilized egg
Vagina	receives the penis of the male during mating

Read on to get more key information about these parts.

The Ovaries

There are two ovaries each comparable to the size of an almond nut in every female. It is suspended in the pelvic cavity by a ligament. The ligament extends from each ovary to the lateral body wall, and the ovarian ligament. The ovary contains an ovarian follicle, which contains an **oocyte** or the female germ cell. When follicles mature, they expand and rupture to release the egg. This process is called **ovulation**. After ovulation, the remaining cells of the ruptured follicle transform into a glandular structure known as the **corpus luteum**.

Fallopian Tubes

The fallopian tubes extend from the area of the ovaries to the uterus. The long and thin processes called **fimbriae** surround the opening of each uterine tube. Fertilization usually occurs in the part of the uterine tube near the ovary.

Uterus

The uterus is as big as a medium-sized pear. Internally, the uterine cavity continues through the cervix as the cervical canal, which opens into the vagina. The larger rounded part is directed superiorly. The part of the uterus superior to the entrance of the uterine tubes is called the **fundus**. The main part is called the **body**, and the narrower part is the cervix, directed inferiorly.

Exploring Drug Delivery to the Peritoneum Ranjita Shegokar, 2023-11-30 The Peritoneal cavity PC is the key metastatic site for intra abdominal malignancies e.g GI tract and rectal cancer PC sites can be used to target several other

diseases where lymphatic drug delivery is desired without dumping large amounts of the drug. Till recently it was thought that treatment with curative intent was impossible but that was challenged by the introduction of cytoreductive surgery CRS and heated intraperitoneal chemotherapy HIPEC and PIPAC pressurized intraperitoneal aerosol chemotherapy. Recently a growing number of preclinical and clinical studies advocate intraperitoneal IP chemotherapy as an alternative post operative therapy for cancer. Although their effectiveness has been proven both experimentally and clinically there is still little understanding of the role of drug delivery systems DDS in targeting drugs in the intraperitoneal IP cavity. There are two main challenges one posed by IP cavity where the residence time of a small molecular weight drug 20 kDa is not sufficiently long to maintain therapeutic effect. This leads to frequent or continuous dosing. Another challenge is device related or catheter related problems such as catheter obstruction increased risk of infection and bowel complications. Overall literature shows that the IP site is satisfactorily explored by clinicians but in terms of drug delivery not that much. One can see a clear cut gap of expertise exchange between the two fields and guidelines from regulatory lawmakers on new medications. ppbr ppIn summary challenges like delivery to IP cavity tumor or organ specific targeting efficient tissue penetration optimal cellular uptake and intracellular residence of a drug biocompatibility toxicity etc can be easily solved by smartly designing functional drug delivery systems both nano and micro. Nanotechnologies have always fascinated humans for several decades and are now widely explored in the biomedical field. Diverse types of nanoparticles are being explored around the world some examples include biodegradable nanoparticles green nanoparticles polymeric nanoparticles lipid nanoparticles metal nanoparticles graphene carbon nanotubes and several others. Now a day s nanoparticles are gaining interest for drug targeting of chemotherapeutic drugs immunotherapy and gene delivery. Whereas microparticles can be explored for delayed drug delivery to the peritoneal cavity due to relatively slow removal from IP fluid. Hydrogels or other adhesive drug delivery may help to enhance peritoneal adhesions thereby maintaining the balance between benefit and risk. Overall drug delivery systems are key in IP targeting. That means drug delivery specialist and clinician needs to be connected to get the best out of this route of drug administration. ppbr ppThe present book is a link between pharmaceutical scientists drug formulators clinicians toxicologists and regulatory experts. This book also provides a new perspective to researchers to divert or guide their research in an optimal way. Exploring Drug Delivery to the Peritoneum serves as a platform for upcoming technologies especially in the medical devices sector to face up and show potential in delivering drugs. It is a chance for commercial partners like insurance companies and the pharma industry to explore this direction. pp pp
