

Types of respiration

All living cells **respire** to release energy. Organisms need energy for everything they do (for example, making new substances, moving).

Aerobic respiration is a **chemical reaction** that can be summarised as:

Energy is released (but is not a chemical substance and so is not shown in the word equation).

Carbon dioxide can be detected using:

- **limewater** (which it turns cloudy)

Aerobic respiration happens in every cell all the time.

Anaerobic respiration does not require oxygen. In humans it is used to release energy from glucose when more energy is needed than can be supplied by aerobic respiration (for example, during strenuous exercise).

Anaerobic respiration causes muscles to tire quickly and so cannot be used for extended periods. Anaerobic respiration releases **less energy** than aerobic respiration, but it happens **more quickly**.

Gas exchange

Different organisms use different organs for **gas exchange** (swapping one gas for another). In humans, we use our **lungs** to exchange **oxygen** and **carbon dioxide**.
