Environmental DNA Pierre Taberlet, Aurélie Bonin, Lucie Zinger, Eric Coissac, 2018-02-02 Environmental DNA eDNA refers to DNA that can be extracted from environmental samples such as soil water feces or air without the prior isolation of any target organism The analysis of environmental DNA has the potential of providing high throughput information on taxa and functional genes in a given environment and is easily amenable to the study of both aquatic and terrestrial ecosystems It can provide an understanding of past or present biological communities as well as their trophic relationships and can thus offer useful insights into ecosystem functioning There is now a rapidly growing interest amongst biologists in applying analysis of environmental DNA to their own research However good practices and protocols dealing with environmental DNA are currently widely dispersed across numerous papers with many of them presenting only preliminary results and using a diversity of methods In this context the principal objective of this practical handbook is to provide biologists both students and researchers with the scientific background necessary to assist with the understanding and implementation of best practices and analyses based on environmental DNA

The effect of muscle pathogenesis on avian physiology, animal welfare, and quality of muscle as a food Wei Guo, Sandra G.

Velleman, Gale M. Strasburg, 2025-05-15 Over the past several decades the poultry industry has achieved huge improvements in global poultry production including with increased growth performance improved body composition higher market weight increased feed efficiency reduced production costs and increased profitability for growers These gains have resulted from a combination of intensive genetic selection tailored nutritional approaches and novel poultry management strategies However these improvements in broiler chicken and turkey production have also come with costs These costs include increased susceptibility to environmental stress increased mortality in commercial poultry flocks and muscle pathogenesis ultimately leading to deleterious effects on meat quality traits affecting appearance texture and protein functionality For example a subset of fast growing domestic turkeys develops spontaneous cardiomyopathy or round heart disease that leads to a mortality rate up to 15% at 2 to 4 weeks of age Even turkeys that survive the critical first two weeks after hatch already have damaged hearts at a prevalence of 80% to 90% which may lead to growth retardation during the grow out phase This syndrome can also occur in broiler chickens which causes major economic losses and limits the maximum profitability in the poultry industry world wide Another example is wooden breast an abnormal muscle condition resulting in a hardening of the breast muscle affecting meat texture Other examples include green muscle disease also known as deep pectoral muscle myopathy spaghetti meat and white striping All of these pathologies include the development of myopathic changes subsequently affecting meat quality leading to consumer complaints and economic losses by the processing industry There is a paucity of information on the etiologies of broiler and turkey muscle pathogenesis and their consequent effects on muscle physiology This Research Topic will highlight the mechanisms of skeletal and cardiac muscle pathogenesis in poultry that are responsible for premature bird mortality and altered quality of muscle as a food This research topic will cover the recent findings in the area of myopathies in poultry Original Research and Review papers among other article types are welcome to be submitted to this collection

Nonparametric Bayesian Inference in Biostatistics Riten Mitra, Peter Müller, 2015-07-25 As chapters in this book demonstrate BNP has important uses in clinical sciences and inference for issues like unknown partitions in genomics Nonparametric Bayesian approaches BNP play an ever expanding role in biostatistical inference from use in proteomics to clinical trials Many research problems involve an abundance of data and require flexible and complex probability models beyond the traditional parametric approaches As this book's expert contributors show BNP approaches can be the answer Survival Analysis in particular survival regression has traditionally used BNP but BNP's potential is now very broad This applies to important tasks like arrangement of patients into clinically meaningful subpopulations and segmenting the genome into functionally distinct regions This book is designed to both review and introduce application areas for BNP While existing books provide theoretical foundations this book connects theory to practice through engaging examples and research questions Chapters cover clinical trials spatial inference proteomics genomics clustering survival analysis and ROC curve
