

Keystone Species

Saguaro Cactus

What is a keystone species?

A keystone species is a species that has a disproportionately large effect on its environment relative to its abundance. The concept was developed by ecologist Robert Paine in the 1960s, based on his studies of intertidal rocky shore communities.

Keystone species play a critical role in maintaining the structure of an ecological community, affecting many other organisms in the ecosystem without being directly consumed by them. They are often the species that hold the community together, and their removal can lead to a dramatic collapse of the ecosystem.

Why is the Saguaro a keystone species?

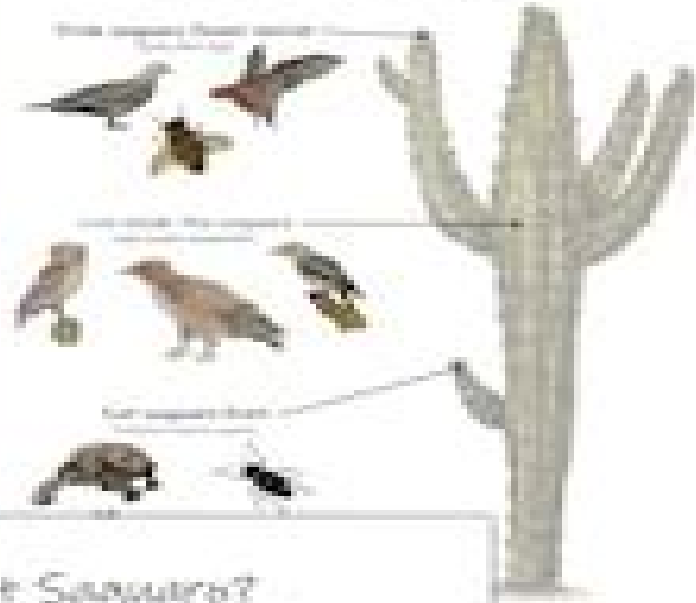

The Saguaro cactus is a keystone species in the Sonoran Desert. It provides food and shelter for many other organisms, including birds, lizards, and insects. The cactus also plays a role in the water cycle, storing water in its thick stems and releasing it into the soil.

For more information on the Saguaro cactus, visit the Sonoran Desert Museum website.
