New Insights in Veterinary Cancer Immunology Carlos Eduardo Fonseca-Alves,Cristina Massoco ,Felisbina Luisa Queiroga,2025-01-14 The tumour microenvironment TME is essential for cancer maintenance and is responsible for several antitumor characteristics such as immune system avoidance resistance to anticancer therapies invasion and metastasis The TME is composed of several components including fibroblasts extracellular matrix proteins pericytes and immune cells The immune cells including T lymphocytes are responsible for fighting cancer cells inducing cell death However cancer cells develop several mechanisms to avoid the immune system including mutations to change the antigens originally recognised by T cells Tumours that can avoid the immune system including the T cell antitumor response are known as nonimmunogenic tumours or cold tumours The main characteristic of this tumour subtype is lack of response to immunotherapy drugs In contrast immunogenic or hot tumours have an active T cell antitumor response and respond well to immunotherapy Therefore elucidating the TME characteristics is the first step for the application in clinical practice In recent years there has been progress in understanding how the immune system and inflammation are associated with different cancer subtypes In 2018 the Nobel Prize in Physiology and Medicine was awarded for the discovery of cancer therapy by the inhibition of negative immune regulation Since then there has been an increase in global attention directed towards the immune system and its implications for cancer therapy Tumour progression is highly dependent of modifications in the TME which are directly related with patient s prognosis and present direct impacts on chemotherapy efficiency Investigating and comprehending the TME composition during tumour progression allows new therapeutic strategies and

approaches personalized to each patient. Thus understanding its complex interactions leads to different strategies to reprogramming TME for therapeutic purposes. The main goal of this special issue is to bring together manuscripts focused on cancer immunology with a translational approach. We welcome Original Research and Review articles from investigators worldwide that will stimulate the continuing efforts to understand the interactions with tumour microenvironment including:

- 1 Identification of immune cells as a prognostic factor for cancer in veterinary patients
- 2 Stratification of tumour in animals according to its immunological content: hot or cold tumours
- 3 Specific therapies targeting immune system components with translational potential
- 4 Genetic and epigenetic cancer modifications associated with the immune cells
- 5 Therapeutic implications of antitumor vaccines in small animals
