Vegetation Simulator Conference, 2008 The Forest Vegetation Simulator FVS is a suite of computer modeling tools for predicting the long term effects of alternative forest management actions FVS was developed in the early 1980s and is used throughout the United States and British Columbia The Third FVS conference held February 13 15 2007 in Fort Collins Colorado contains 20 papers They describe the use of FVS on the stand and landscape scale and to analyze fuels management in the presence of insects and fire Several papers compare FVS predictions of the effects of insects and disease to field measurements FVS is continually evolving and improving in technology and capability to meet the needs of its ever increasing user community Papers describe new methods for data acquisition and preparation for input to FVS new economic analysis capabilities within FVS new methods for simulating forest regeneration new developments in calculating growth and mortality and future plans for incorporating the effects of climate change in model simulations **NASA SP.**, 1962

Analysis and Modelling of Water Supply and Demand Under Climate Change, Land Use Transformation and Socio-Economic Development Katharina Fricke, 2013-12-12 Located in a narrow grassland corridor between the semi desert and a mountain range in Northwest China the research area Urumqi Region is despite its semi arid climate in a relatively favourable hydrological situation The nearby mountains provide water for settlements and agriculture making human development possible in the first place Due to the development of agriculture population and economy during the last sixty years and the increasing water consumption a demand and population driven water scarcity exists today and is expected to aggravate At the same time the effects of climate change and land use transformations on the hydrological system and the water availability are uncertain This study evaluates the recent and future situation by combining a hydrological water balance model for the simulation of the water supply based on scenarios of climate and land use change with a socio economic model for projecting the future water demand including predicted growth of population and economy
