¹Basavarajappa, ²D. Venkatesan, and ³M. Vidya

The present study is an attempt to revalidate and develop normative data on a non-verbal test of intelligence-Seguin Form Board (SFB). The SFB was administered on a sample of 720 children including 361 boys and 359 girls between age group of 36-120 months (Mean Age: 89.19 months; SD: 20.82) drawn from rural and urban areas and belonging to different social economic status groups. Results indicate that SFB continues to remain a valid and reliable speed test of intelligence at lower age levels of children. However, there is need to evolve separate norms on SFB for different age groups, socio-economic status levels, and area of residence (rural and urban) respectively. An attempt is also made in this study to demonstrate a modified procedure of test performance as relatively more appropriate, superior and effective for estimation of mental ages/IQ of children on this test.

Keywords: Seguin Form Board, normative data, Indian norms, chronological age, mental age, modified administration

Prior to Itard's (1932) pioneering work, attempts were made to assess the intellectual (non-verbal) abilities of children who could not or would not speak more directly. Seguin (1856) developed a simple but a unique testing method using form boards for assessment of intellectual abilities in children through non-verbal means. The instrument and its many derivatives have become widely used and are well known universally as Seguin Form Board (SFB) (Du Bois, 1970). Stanford-Binet Intelligence Scale includes a Seguin-like form board, a merger of efforts by Binet, Simon and Seguin -the three pioneers in the field of intelligence test development. Since early 1900s, non-verbal intelligence testing has developed methods for assessing cognitive functioning of children who could not or would not speak. The SFB was basically constructed as teaching aid under 'Physiological Method' for children with mental retardation (Seguin, 1866). Later, it was used to assess general intelligence of children in pre-primary and primary school years (Spearman, 1927); or for measuring visual discrimination and matching, eye-hand coordination and cognitive-perceptual abilities

in children (David & Virginia, 1972). Wallin (1916) regards the SFB as a most useful device to test form perception, movement and intelligence-that is, psycho-motor development. Form Board tests were also used for measurement of ability to manipulate concrete material in contrast to verbal/abstract ability. Wallin (1916) observed that the performance (speed) on form board increases with chronological and mental age-more rapidly in early years. He suggested that tests are of little value diagnostically unless periodically fortified with reliable age norms. According to David and Virginia (1972), analysis of SFB test has shown that vector loadings for the test to differ among age levels, indicating that the test may be measuring different abilities at different age levels.

There have been efforts to develop Indian norms for SFB from time to time. In a survey on Mumbai school children (N= 378) within a limited age range (6-8 years), the speed of performance was found to be slower than their Western counterparts (Ramachandran, Deshpande, Apte, .. Shukla, and Shah, (1968). Around the same time, Bharatraj (1971) improved on the sample
