the authors' conclusions. A comparison between the two sets of results is presented in Table 1. The results show that the two sets of results are very similar, with the only significant difference being in the estimate of the effect of the variable "Age". The estimate of the effect of "Age" is significantly positive in the first set of results, but significantly negative in the second set of results. This difference may be due to the fact that the first set of results is based on a sample of 100,000, while the second set of results is based on a sample of 50,000. The smaller sample size in the second set of results may lead to a more precise estimate of the effect of "Age".

Abstract: The purpose of this study was to determine the effect of a 12-week training program on the physical fitness of 10-year-old children. The study was conducted in a primary school in the city of Ankara, Turkey. The study group consisted of 20 children (10 boys and 10 girls) who were randomly selected from the school. The children were divided into two groups: a control group and an experimental group. The control group did not participate in any physical activity during the study period. The experimental group participated in a 12-week training program that included aerobic, strength, and flexibility exercises. The physical fitness of the children was measured at the beginning and at the end of the study period. The results of the study showed that the experimental group had significantly higher levels of physical fitness than the control group at the end of the study period. The study suggests that a 12-week training program can improve the physical fitness of 10-year-old children.
