Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 sedentary women, 40 to 50 years of age, who were randomly assigned to a 12-week training program or a control group. The training program consisted of three sessions per week, each lasting 30 minutes, and included a combination of aerobic and resistance exercises. The control group consisted of 12 sedentary women who did not participate in the training program. The HR and EE were measured at rest and during the training sessions. The results showed that the training program significantly increased the HR and EE of the subjects compared to the control group. The HR increased from 68 to 78 beats per minute, and the EE increased from 1,200 to 1,500 kcal per day. The findings suggest that a 12-week training program can effectively increase the HR and EE of sedentary, middle-aged women.
