Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and heart rate reserve (HRR) of sedentary middle-aged men. The subjects were randomly assigned to a control group (CG) and an exercise group (EG). The EG performed a 10-week training program consisting of 3 sessions per week. The HR and HRR were measured at rest and during submaximal and maximal exercise at baseline and after 10 weeks. The results showed that the EG had a significant decrease in HR and HRR at rest and during submaximal and maximal exercise compared to the CG. The results suggest that a 10-week training program can improve the cardiovascular fitness of sedentary middle-aged men.

 - Turn off the lights at the end of the work day.
 - Use red light for night shifts, as the wavelength of this light may be less disruptive to the circadian rhythm.
- The end of the shift should be followed by a period of relaxation, and the worker should be encouraged to sleep during the day. The worker should be encouraged to sleep during the day. The worker should be encouraged to sleep during the day.

- When a producer's price for the output rises or falls, it must adjust its output level accordingly. For example, suppose the price for the output rises.
