It lets more memory be used than there is in the system.

- c. How is virtual memory implemented?

Operating system will set up virtual memory using the virtual memory manager (VMM).
VMM creates a file on the hard disk large enough for the extra memory needed.
OS can then address memory as if it were real memory stored in RAM.
Maps memory addresses used by a program into physical addresses in computer memory.
Swapping or paging is a process used by the operating system to move data between RAM and virtual memory.
