Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 10 women, 40 to 50 years of age, who were sedentary and had no cardiovascular or pulmonary disease. The subjects were randomly assigned to a 10-week training program or a control group. The training program consisted of three sessions per week of 30 minutes of moderate-intensity aerobic exercise. The control group consisted of 10 women who did not exercise. The HR and EE were measured at rest and during exercise at the beginning and end of the 10-week period. The HR and EE were significantly higher in the training group than in the control group at the end of the 10-week period. The results of this study suggest that a 10-week training program can improve the HR and EE of sedentary, middle-aged women.

- Day and night periods that are longer than the standard 24 hours occur most commonly with the use of artificial or non-natural light sources. To avoid this, there are laws in the province that regulate the use of artificial light.
- Artificial sources of light will commonly interfere with the natural circadian rhythms, the length of the day and night, depending on the use of indoor lighting.
- The use of artificial light at night may change the pineal gland's production of melatonin, a hormone that regulates sleep. Sleep is most likely to be disrupted when there is artificial light at night. Sleep is most disrupted when the light is bright.
