further promotion of science and technology The second goal was to establish a friendly relationship between the Swiss and the Japanese The last but not least aim was to disseminate information about our plans by publishing the proceedings of this seminar We thought that publishing the outcome of the seminar would be essential in order not to store the treasure the seminar results secretly

Conceptual Perspectives in Quantum Chemistry Jean-Louis Calais, Eugene S.

Kryachko, 2012-12-06 The rivers run into the sea yet the sea is not full Ecclesiastes What is quantum chemistry The straightforward answer is that it is what quantum chemists do But it must be admitted that in contrast to physicists and chemists quantum chemists seem to be a rather ill defined category of scientists Quantum chemists are more or less physicists basically theoreticians more or less chemists and by large computationists But first and foremost we quantum chemists are conscious beings We may safely guess that quantum chemistry was one of the first areas in the natural sciences to lie on the boundaries of many disciplines We may certainly claim that quantum chemists were the first to use computers for really large scale calculations The scope of the problems which quantum chemistry wishes to answer and which by its unique nature only quantum chemistry can answer is growing daily Retrospectively we may guess that many of those problems meet a daily need or are say technical in some sense The rest are fundamental or conceptual The daily life of most quantum chemists is usually filled with grasping the more or less technical problems But it is at least as important to devote some time to the other kind of problems whose solution will open up new perspectives for both quantum chemistry itself and for the natural sciences in general

Initiation and Control of Gait from First Principles: A Mathematically

Animated Model of the Foot Craig Nevin, 2010-05-21 This thesis examines the anatomical locations of the dynamic pressures that create the first five footprints when a standing person starts to walk It is hypothesized that the primary activity starts with the dorsiflexion or lifting of the great toe Consequently the metatarsophalangeal region of the forefoot was studied from three directions Viewed side on the great toe free body is found from a detailed post hoc analysis of previous kinematic data obtained from cadavers to operate as a cam The cam model also follows closely from Aristotle's ancient description of the hinged instrument of animate motion Viewed in coronal cross section the first metatarsal torsion strength was estimated in 13 humans 1 gorilla 3 chimpanzees 1 orangutan and 1 baboon set of dry bone specimens of the hands and feet The first metatarsal bone alone contributes 43% of the total strength of all the metatarsal bones A result unique amongst the hominids and apes studied Viewed in horizontal plan the dynamic components and principle axes of the footprints of 54 barefoot humans 32 male 22 female age 32 11 years were studied whilst standing on a 0.5m pressure plate and then immediately when walking over a 2m plate 4 sensors per cm² sampled at 100hz Two footprints were obtained during the initial stance posture and the first three footprints of the initial walk Three new principles of animate motion were deduced from the divergent results obtained from complete and dissected cadavers The metatarsal cam from the sagittal side view the ground reaction torque from the frontal coronal view and the amputation artifact The philosophy of experimenting

on inanimate cadavers rather than living subjects was intensively researched. Instead of assuming that gait is a uniform or regular motion as is usual, the foot was analyzed rather as if it was a beam attached to the ground. Engineering equations were used to determine the flexural properties of the foot every 0.01 seconds, including the principle axes, radius of gyration, and the local shear stresses on the sensors spaced 5.7 mm apart. A sequence of these impressions creates a mathematically animated model of the footprint. The local force under the foot was normalized against both the total force and contact duration. The forces under the foot were each divided between 10 anatomical regions using individual masks for each foot strike. Producing a 54 subject database from which the normal behavior of the foot could be quantified. The group showed a surprisingly low right foot step off dominance of only 54%. The combination of the radius of gyration and impulse in particular produces a succinct but powerful summary of the footprint during dynamic activity. The initial angle and magnitudes of the loads that are applied and removed demonstrates that the body first rocks onto the heels after the instruction to walk is given. The feet simultaneously invert and their arches rise off the ground as anticipated. The principle axes were then animated in a mathematical four dimensional model. The horizontal radius of gyration is on average 5 cm during heel strike but increases to 20 cm as the forefoot comes into contact with the ground, finally rising to 25 cm at toe off. Significantly, the applied load during the fore foot loading phase is more widely distributed than the load being removed. A new and unanticipated result that is believed to be a special characteristic of the animate foot. The standard deviation of the force under the great toe is the first mechanical parameter to converge in the 54 subjects, conclusively verifying the hypothesis that the great toe both initiates and controls gait.

Scanning Probe Microscopy and Spectroscopy Roland Wiesendanger, 1994-09-29. The investigation and manipulation of matter on the atomic scale have been revolutionised by scanning tunnelling microscopy and related scanning probe techniques. This book is the first to provide a clear and comprehensive introduction to this subject. Beginning with the theoretical background of scanning tunnelling microscopy, the design and instrumentation of practical STM and associated systems are described in detail, as are the applications of these techniques in fields such as condensed matter physics, chemistry, biology and nanotechnology. Containing 350 illustrations and over 1200 references, this unique book represents an ideal introduction to the subject for final year undergraduates in physics or materials science. It will also be invaluable to graduate students and researchers in any branch of science where scanning probe techniques are used.
