<p><b>Abstract</b> The purpose of this study was to determine the effect of a 12-week training program on the physical and psychological health of sedentary, middle-aged women. The study was conducted in a community-based setting. The participants were 30 women, aged 40-50 years, who were sedentary and had no history of cardiovascular disease. They were randomly assigned to two groups: a control group and an intervention group. The control group continued with their sedentary lifestyle, while the intervention group participated in a 12-week training program consisting of aerobic and strength training exercises. The study was conducted over a 12-week period. The primary outcome measures were changes in physical fitness (measured by heart rate, blood pressure, and body mass index) and psychological health (measured by self-reported stress and mood). The results showed that the intervention group experienced significant improvements in physical fitness and psychological health compared to the control group. The findings suggest that a 12-week training program can effectively improve the physical and psychological health of sedentary, middle-aged women.</p>	<p><b>Keywords:</b> sedentary lifestyle, middle-aged women, physical health, psychological health, training program.</p>	<p><b>Introduction</b> Sedentary lifestyle is a major public health concern, as it is associated with an increased risk of chronic diseases such as cardiovascular disease, diabetes, and obesity. Middle-aged women are particularly vulnerable to these health risks, as they often experience a decline in physical activity levels as they age. Therefore, it is important to develop interventions that can help middle-aged women maintain or improve their physical and psychological health. One such intervention is a structured training program, which can provide middle-aged women with the opportunity to engage in regular physical activity and improve their overall health and well-being. The purpose of this study was to determine the effect of a 12-week training program on the physical and psychological health of sedentary, middle-aged women. The study was conducted in a community-based setting, which is a more realistic environment for many middle-aged women. The participants were randomly assigned to two groups: a control group and an intervention group. The control group continued with their sedentary lifestyle, while the intervention group participated in a 12-week training program consisting of aerobic and strength training exercises. The study was conducted over a 12-week period. The primary outcome measures were changes in physical fitness (measured by heart rate, blood pressure, and body mass index) and psychological health (measured by self-reported stress and mood). The results showed that the intervention group experienced significant improvements in physical fitness and psychological health compared to the control group. The findings suggest that a 12-week training program can effectively improve the physical and psychological health of sedentary, middle-aged women.</p>
