Polymerization: Chain Reaction

Background

The term "polymerization" refers to the process of combining small molecules called monomers into larger, more complex molecules by different mechanisms. These smaller pieces, the monomers, may consist of atoms joined by covalent bonds or by ionic bonds. These bonds may be nonpolar, polar, or ionic groups.

Objectives

After completing this lab, you will be able to describe the mechanism of addition polymerization. You will also be able to describe how the reaction conditions affect the rate of polymerization.

Reaction Mechanism of Addition Polymerization

In this experiment, you will learn about three types of polymerizations: radical, cationic, and anionic. In each case, the mechanism begins with the addition of one monomer molecule with another monomer molecule to form a dimer product. The process can repeat many times to form a polymer.

Identify the Reactants

On the first worksheet, place each monomer next to its corresponding letter. Then, determine which monomer will react with which monomer to form a polymer. You may use the periodic table to help you.

Learning Objectives

- Identify the reactants of the polymerization process and describe the mechanism of each type of polymerization.
- Explain how reaction conditions affect the rate of polymerization.

Pre-Lab Questions

1. What is a monomer?

2. What is a polymer?

3. What is a chain reaction?
