## Lesson Summary

### Describing Populations

**Life expectancy** is the average number of years a person is expected to live. The life expectancy of a population is described by the age pyramid or graph. It shows the age, sex, and number of people in a population.

**Change after 10 years** is the percentage change in population size after 10 years. It is calculated by dividing the change in population size by the original population size and multiplying by 100. For example, if a population of 100 people grows to 110 people after 10 years, the change after 10 years is 10%.

**Birth rate** is the number of live births per 1,000 people per year. It is calculated by dividing the number of live births by the total population and multiplying by 1,000. For example, if a population of 100 people has 10 live births per year, the birth rate is 10%.

Environmental Genomics is a comprehensive introduction to a fast moving field that is transforming the practice of environmental management with profound relevance to industry government and the public *Komodo Dragons* James B. Murphy, Claudio Ciofi, Colomba de La Panouse, Trooper Walsh, 2015-03-31 More than twenty years have passed since Walter Auffenberg's monumental *The Behavioral Ecology of the Komodo Monitor*. In the intervening years the populations of Komodo dragons native only to a handful of islands in southeast Indonesia have dwindled sparking intensive conservation efforts. During the last two decades new information about these formidable predators has emerged and the most important findings are clearly presented here. A memoir from Walter Auffenberg and his son Kurt is followed by the latest information on Komodo dragon biology ecology population distribution and behavior. The second part of the book is dedicated to step by step management and conservation techniques both for wild and captive dragons. This successful model is a useful template for the conservation of other endangered species as well for as Kurt and Walter Auffenberg note. The species may well indeed survive in the wild for generations to come while countless other organisms are lost. **Structured Population Models in**

**Biology and Epidemiology** Pierre Magal, Shigui Ruan, 2008-04-12 In this new century mankind faces ever more challenging environmental and public health problems such as pollution invasion by exotic species the emergence of new diseases or the emergence of diseases into new regions West Nile virus SARS Anthrax etc and the resurgence of existing diseases in uenza malaria TB HIV AIDS etc. Mathematical models have been successfully used to study many biological epidemiological and medical problems and nonlinear and complex dynamics have been observed in all of those contexts. Mathematical studies have helped us not only to better understand these problems but also to find solutions in some cases such as the prediction and control of SARS outbreaks understanding HIV infection and the investigation of antibiotic resistant infections in hospitals. Structured population models distinguish individuals from one another according to characteristics such as age size location status and movement to determine the birth growth and death rates interaction with each other and with environment infectivity etc. The goal of structured population models is to understand how these characteristics affect the dynamics of these models and thus the outcomes and consequences of the biological and epidemiological processes. There is a very large and growing body of literature on these topics. This book deals with the recent and important advances in the study of structured population models in biology and epidemiology. There are six chapters in this book written by leading researchers in these areas. **Foundations for Population Health in Community/Public Health Nursing - E-Book** Marcia
