Background

The Respiratory System

A healthy respiratory system is essential for an individual's overall health, and respiratory diseases are common. The respiratory system is the part of the body that takes in oxygen from the air and exchanges it with carbon dioxide. The lungs are the primary organs of the respiratory system, and they are responsible for the exchange of gases. The trachea and bronchi are the airways that lead to the lungs.

The lungs take in a large portion of the oxygen used and are attached to the surface of the thoracic cavity by a double pleural membrane. The pleural membrane produces a fluid that lubricates the lungs and prevents them from sticking to the chest wall. The trachea and bronchi are the airways that lead to the lungs. The trachea is the main airway, and the bronchi are the smaller airways that branch off from the trachea. The lungs are the primary organs of the respiratory system, and they are responsible for the exchange of gases.

The amount of oxygen required by the body and carbon dioxide produced by the body are directly proportional to the metabolic rate of the body. The metabolic rate is the rate at which the body uses energy. The metabolic rate is affected by many factors, including age, sex, and activity level. The metabolic rate is also affected by the amount of oxygen and carbon dioxide in the air. The metabolic rate is the rate at which the body uses energy, and it is affected by many factors.
