1. The entire part of the neuron beyond the cell body is known as the neurite.

The major function of the neuron is to transmit information rapidly from one end of the body to another.

2. It is composed of cell body and neurite (axon and dendrite).

The cell body is called the soma. It is the part of the neuron where the cell nucleus, mitochondria, Golgi apparatus and rough endoplasmic reticulum are located.

3. The neurite is divided into two parts: axon and dendrite.

Part	Structure	Function	Location
Cell body	Contains nucleus, mitochondria, Golgi apparatus, rough endoplasmic reticulum	Site of protein synthesis and organelle maintenance	Central nervous system
Axon	Long, thin projection from the cell body	Transmits electrical impulses away from the cell body	Peripheral nervous system
Dendrite	Short, branched projection from the cell body	Receives signals from other neurons	Central nervous system

4. The axon is covered by a myelin sheath.

Anatomy & Physiology Elaine Nicpon Marieb, 2005 *The Human Body: Concepts of Anatomy and Physiology* Bruce Wingerd, Patty Bostwick Taylor, 2020-04-06 The new edition of Bruce Wingerd's *The Human Body Concepts of Anatomy and Physiology* helps encourage learning through concept building and is truly written with the student in mind. Learning Concepts divide each chapter into easily absorbed subunits of information making learning more achievable. Since students in a one semester course may have little experience with biological and chemical concepts giving them tools such as concept statements, concept check questions, and a concept block study sheet at the end of each chapter help them relate complex ideas to simple everyday events. The book also has a companion Student Notebook and Study Guide available separately that reinvents the traditional study guide by giving students a tool to help grasp information in class and then reinforce learning outside of class.
