Protein Interaction Networks in Health and Disease Spyros Petrakis, Miguel A.

Andrade-Navarro, 2016-10-19 The identification and mapping of protein-protein interactions (PPIs) is a major goal in systems biology. Experimental data are currently produced in large scale using a variety of high throughput assays in yeast or mammalian systems. Analysis of these data using computational tools leads to the construction of large protein interaction networks which help researchers identify novel protein functions. However, our current view of protein interaction networks is still limited and there is an active field of research trying to further develop this concept to include important processes: the topology of interactions and their changes in real time; the effects of competition for binding to the same protein region; PPI variation due to alternative splicing or post-translational modifications etc. In particular, a clinically relevant topic for development of the concept of protein interaction networks is the consideration of mutant isoforms which may be responsible for a pathological condition. Mutations in proteins may result in loss of normal interactions and appearance of novel abnormal interactions that may affect a protein's function and biological cycle. This Research Topic presents novel findings and recent achievements in the field of protein interaction networks with a focus on disease. Authors describe methods for the identification and quantification of PPIs; the annotation and analysis of networks considering PPIs and protein complexes formed by mutant proteins associated with pathological conditions or genetic diseases. Lu,Qihua Fu,2022-11-07 Hair Follicle Stem Cell Regeneration in Aging Mingxing Lei,Sung-Jan Lin,Cheng Ming Chuong,2022-01-18 Molecular mechanisms of cellular stress responses in cancer and their therapeutic implications Megan Chircop,Daniel Speidel,2015-03-06 In response to stress cells can activate a myriad of signalling pathways to bring about a specific cellular outcome including cell cycle arrest DNA repair senescence and apoptosis This response is pivotal for tumour suppression as all of these outcomes result in restriction of the growth and or elimination of damaged and pre malignant cells Thus a large number of anti cancer agents target specific components of stress response signalling pathways with the aim of causing tumour regression by stimulating cell death However the efficacy of these agents is often impaired due to mutations in genes that are involved in these stress responsive signalling pathways and instead the oncogenic potential of a cell is increased leading to the initiation and or progression of tumourigenesis Moreover these genetic defects can increase or contribute to resistance to chemotherapeutic agents and or radiotherapy Modulating the outcome of cellular stress responses towards cell death in tumour cells without affecting surrounding normal cells is thus one of the ultimate aims in the development of new cancer therapeutics To achieve this aim a detailed understanding of cellular stress response pathways and their aberrations in cancer is required This Research topic aims to reflect the broadness and complexity of this important area of cancer research **Cinnamon** Ranjith Senaratne,Ranjith Pathirana,2021-01-25 Cinnamon is the common name for the spice obtained from the dried inner bark of several species of the genus Cinnamomum in the Lauraceae family In world trade Cinnamomum cassia L J Presl Cinnamomum burmannii dominate but it is of a different quality to true or Ceylon cinnamon produced from Cinnamomum zeylanicum Blume C verum J Presl with the latter much easier to process giving a more delicate sweeter flavor with nuances of clove but more importantly with only traces often below detection thresholds of coumarin
