## Principles of Heredity

Gregor Mendel was a scientist and monk who lived in the 1800s and is known as the “father of genetics.” He made important discoveries about how traits, like eye color or height, are passed from parents to their children. Mendel did experiments with pea plants in a garden at his monastery. He carefully studied how traits such as flower color and plant height were inherited through generations. By planting and observing thousands of pea plants, he noticed patterns in how these traits appeared, which helped him figure out the basic rules of heredity.

Mendel discovered that traits are passed down through tiny units called genes (though he didn’t know that word at the time). He learned that each trait is controlled by two “factors,” now known as alleles—one from each parent. These alleles can be dominant (stronger and more likely to show up) or recessive (weaker and hidden unless both alleles are recessive). For example, if a tall pea plant (dominant trait) is crossed with a short one (recessive trait), the first generation might all be tall, but in the next generation, some short plants could appear again. Mendel’s work helped us understand why children can look like their parents, grandparents, or even relatives from generations before.
