

A chemical equation is a representation of a chemical reaction in which the reactants are written using chemical formulas, followed by an arrow.

Chemical equation: $2H_2 + O_2 \rightarrow 2H_2O$

A coefficient represents the number of atoms or molecules of a substance that are involved in a chemical reaction. A coefficient is placed directly in front of a chemical formula.

A subscript is placed after the element symbol to indicate the number of atoms of that element in a molecule.

Why is it important to balance chemical equations?

Chemical equations must be balanced to show that the number of atoms of each element is the same on both sides of the equation. This is because matter is neither created nor destroyed in a chemical reaction.

What does the law of conservation of mass state when balancing equations?

The law of conservation of mass states that the total mass of the reactants is equal to the total mass of the products in a chemical reaction.

Week 8, Day 2

How does a positive ion form from a neutral atom? What is another name for a positive ion?

A positive ion forms when an atom loses one or more electrons. It is called a cation.

How does a negative ion form from a neutral atom? What is another name for a negative ion?

A negative ion forms when an atom gains one or more electrons. It is called an anion.

Chemical equation: $2H_2 + O_2 \rightarrow 2H_2O$

Atoms are formed by losing the first part of the element symbol and adding the suffix -ion. For example, an atom of sodium, Na, is called a sodium ion.
