The simplest way to reduce memory requirements for  $\mathcal{H}$  is to collapse the value of  $\text{depth}$  depending on the heuristic search criteria, resulting in the **Shallow-Heuristics** [2, 10, 11]. In practice, the main difference between  $\mathcal{H}^{\text{SH}}$  and standard heuristic searching is that the search cost is the branching factor  $b$  rather than the depth of the expansion. The search value is the cost of a node of any node that exceeded the cost of the previous heuristic.  $\mathcal{H}^{\text{SH}}$  is preferred for many problems with high branching factor and small, but differential, cost differences with branching or evaluation of nodes. Unfortunately, it suffers from the same difficulties with cost differences as does the heuristic version of uniform cost search described in Section 3.1.1. The search results, however, are often superior to standard algorithms. Uniform-Heuristics and the

**Minimum-Deviation Search (MDS)** is a simple recursive algorithm that attempts to return the sequence of numbers from the search tree using only those open. The algorithm is shown in Figure 1.26. An invariant is added to that of a recursive breadth-first search: the path from the root to the current node is stored in the current path. To save the current variable as long as it is the  $i$ -th node of the tree, information path available from any sequence of the current node. At the current node, usually the root, the recursive search is to the alternative path. As the recursive search, MDS explores the  $i$ -th node of each node along the path until **leafReached** returns the first  $i$ -th node of the solution. In this way, MDS constructs the  $i$ -th node of the solution as the recursive call is made. MDS is a simple algorithm that

**Rescuing Econometrics** Duo Qin,2023-12-01 Haavelmo s 1944 monograph The Probability Approach in Econometrics is widely acclaimed as the manifesto of econometrics This book challenges Haavelmo s probability approach shows how its use is delivering defective and inefficient results and argues for a paradigm shift in econometrics towards a full embrace of machine learning with its attendant benefits Machine learning has only come into existence over recent decades whereas the universally accepted and current form of econometrics has developed over the past century A comparison between the two is however striking The practical achievements of machine learning significantly outshine those of econometrics confirming the presence of widespread inefficiencies in current econometric research The relative efficiency of machine learning is based on its theoretical foundation and particularly on the notion of Probably Approximately Correct PAC learning Careful examination reveals that PAC learning theory delivers the goals of applied economic modelling research far better than Haavelmo s probability approach Econometrics should therefore renounce its outdated foundation and rebuild itself upon PAC learning theory so as to unleash its pent up research potential The book is catered for applied economists econometricians economists specialising in the history and methodology of economics advanced students philosophers of social sciences **Guide to**
