True Digital Control C. James Taylor, Peter C. Young, Arun Chotai, 2013-05-29 True Digital Control Statistical Modelling and Non Minimal State Space Design develops a true digital control design philosophy that encompasses data based model identification through to control algorithm design robustness evaluation and implementation With a heritage from both classical and modern control system

synthesis this book is supported by detailed practical examples based on the authors' research into environmental mechatronic and robotics systems. Treatment of both statistical modelling and control design under one cover is unusual and highlights the important connections between these disciplines. Starting from the ubiquitous proportional integral controller and with essential concepts such as pole assignment introduced using straightforward algebra and block diagrams, this book addresses the needs of those students, researchers and engineers who would like to advance their knowledge of control theory and practice into the state space domain and academics who are interested to learn more about non-minimal state variable feedback control systems. Such non-minimal state feedback is utilised as a unifying framework for generalised digital control system design. This approach provides a gentle learning curve from which potentially difficult topics such as optimal stochastic and multivariable control can be introduced and assimilated in an interesting and straightforward manner. Key features: Covers both system identification and control system design in a unified manner. Includes practical design case studies and simulation examples. Considers recent research into time variable and state dependent parameter modelling and control. Essential elements of adaptive and nonlinear control system design and the delta operator, the discrete time equivalent of the differential operator systems. Accompanied by a website hosting MATLAB examples. True Digital Control. Statistical Modelling and Non-Minimal State Space Design is a comprehensive and practical guide for students and professionals who wish to further their knowledge in the areas of modern control and system identification. **Attractive Ellipsoids in Robust Control**

Alexander Poznyak, Andrey Polyakov, Vadim Azhmyakov, 2014-09-29. This monograph introduces a newly developed robust control design technique for a wide class of continuous time dynamical systems called the attractive ellipsoid method. Along with a coherent introduction to the proposed control design and related topics, the monograph studies nonlinear affine control systems in the presence of uncertainty and presents a constructive and easily implementable control strategy that guarantees certain stability properties. The authors discuss linear style feedback control synthesis in the context of the above mentioned systems. The development and physical implementation of high performance robust feedback controllers that work in the absence of complete information is addressed with numerous examples to illustrate how to apply the attractive ellipsoid method to mechanical and electromechanical systems. While theorems are proved systematically, the emphasis is on understanding and applying the theory to real world situations. **Attractive Ellipsoids in Robust Control** will appeal to undergraduate and graduate students with a background in modern systems theory as well as researchers in the fields of control engineering and applied mathematics. Structured Controllers for Uncertain Systems Rosario Toscano, 2013-05-29 Structured Controllers for Uncertain Systems focuses on the development of easy to use design strategies for robust low order or fixed structure controllers particularly the industrially ubiquitous PID controller. These strategies are based on a recently developed stochastic optimization method termed the Heuristic Kalman Algorithm HKA the use of which results in a simplified methodology that enables the solution of the structured control problem without a profusion of user defined parameters. An overview of the main stochastic methods employable in the context of continuous non convex optimization problems is also provided and various optimization criteria for the design of a structured controller are considered. H_2 and mixed H_2/H_∞ each merits a chapter to itself. Time domain performance specifications can be easily incorporated in the design.
