Sensors In 1nz Gearbox:

Turbomachinery International Handbook, 2005 *Automotive Sensors*, Michael Hereward Westbrook, J. D. Turner, 1994
For scientists and engineers doing research and development in either the automotive industry or in the field of sensors reviews the major automobile based sensors currently in use along with details of their construction operation characteristics and method of use Also reviews the history of such sensors and describes sensors that are now und **Gear Fault**

Detection Using Non-contact Magnetic Rotation Position Sensors Michael Taylor, 2010 This thesis is an investigation of possible applications for a low cost non contact magnetic rotational position sensor A single stage gearbox operating spur gears was instrumented with these sensors along with typical optical encoders These rotational position devices were used independently to measure gearbox Transmission Error TE during operation Basic filtering techniques were used to condition the TE so that localized faults were observable Characteristic feature extraction on the TE using RMS Kurtosis and Crest Factor was used to quantify gearbox dynamics These features were able to measure dynamic changes in gearbox health such as wearing in the gears or the progression of a fault resulting in full tooth failure These sensor attributes are ideal for machine condition monitoring applications where catastrophic failure can be forewarned by incipient fault detection

Sensors for an Electronic Automatic Transmission John Christian Pflueger, 1985 *Development of Novel Gearbox Lubrication Condition Monitoring Sensors in the Context of Wind Turbine Gearboxes* Andrew Hamilton, 2015 Wind power has become established as an alternative power source that forms a significant proportion of national energy generation An increasing proportion of turbines is being constructed offshore to exploit higher average wind speeds and to avoid development issues associated with onshore wind farms Isolated locations and unpredictable weather conditions lead to increased access costs for operators when conducting scheduled and unscheduled maintenance and repairs This has increased interest in condition monitoring systems which can track the current state of components within a wind turbine and provide operators with predicted future trends Asset management can be improved through condition based maintenance regimes and preventative repairs Development of novel condition monitoring systems that can accurately predict incipient damage can optimise operational performance and reduce the overall level of wind turbine generation costs The work described in this thesis presents the development of novel sensors that may be applied to monitor wind turbine gearboxes a component that experiences relatively high failure rates and causes considerable turbine downtime Current systems and technology that may be adapted for use in wind turbine condition monitoring are evaluated Lubrication related monitoring systems have been identified as an area that could be improved and are divided into those that track liberated wear material suspended in the lubricant and those that assess the state of the lubricant itself This study presents two novel lubrication based gearbox monitoring sensors that potentially offer a low cost solution for continuous data capture The first demonstrates the potential for active pixel sensors such as those found in digital cameras to capture images of wear particles

within gearbox lubricants Particle morphology was tracked in this system allowing the type of particles to be correlated with the type of wear that is generated and a potential source The second sensor uses a targeted form of infra red absorption spectroscopy to track changes in the lubricant chemistry due to the increase in acidity Ensuring the lubricant is functioning correctly decreases component stress and fatigue reducing maintenance requirements

Integration of Tri-axial (3D) Hall Effect Sensor Technology in Gear Position Sensing of Truck Transmission John Manyala,2010 In this work a linear position sensor module with a Hall Effect element for gear position sensing with a truck transmission is presented The work involves the design of position sensor module structure computer modeling of sensor performance fabrication of sensor prototype and prototype testing and characterization The significance of the work is that a low cost linear position sensor module has been developed with high linearity for use in truck transmission for gear position sensing A smarter sensor design isn't just about optimizing sensing precision and dynamic performance In many manufacturing environments product durability and reliability under harsh conditions is just as important There is no glory for the world's most productive machine if it doesn't run nearly 100% of the time Therefore when it comes to dealing with extreme environmental conditions smarter sensors are expected to be precise accurate cost effective and long lasting For this project the Hall Effect technology has been explored and custom fitted with appropriate electronics to meet the wide requirement profile of a truck transmission The performance characteristics of linear Hall Effect sensors for non contact determination of the position of a moveable permanent magnet along a pre established path are analyzed The complete sensor system is designed for ease of manufacturing and application in the harsh transmission environments
