Standard: Spring weights are measured in the vertical direction, at a distance of about 1.5 in. from the center of rotation. Since force is directly proportional to the length of spring legs, an 8" Standard Spring has a spring force 2.5 times that of a 3.2" Standard Spring.

- Abstract**—This paper presents a new approach to the problem of detecting and localizing faults in a system. The approach is based on the use of a fault detection and isolation (FDI) algorithm which is able to detect and isolate faults in a system. The FDI algorithm is based on the use of a set of residual signals which are generated by a set of observers. The observers are designed such that they are sensitive to faults in the system. The FDI algorithm is able to detect and isolate faults in a system. The approach is applied to the detection and localization of faults in a system.
