CHEMICAL BONDS AND ELECTRONEGATIVITY

Electronegativity is a measure of the ability of an atom to attract electrons. It is a relative property, and the most electronegative element is fluorine. Electronegativity increases from left to right across the periodic table and from bottom to top.

The difference in electronegativity between two atoms determines the type of bond that will form between them. If the difference is small, a covalent bond will form. If the difference is large, an ionic bond will form.
