disciplinary clinical epidemiological and quantitative modelling studies can have in relation to outcomes potentially affecting the quality of life of many people. Complex systems including those characterizing biomedicine are assessed in both their functionality and stability and also relatively to the capacity of generating information from diversity, variation and complexity. Due to the combined interactions and effects, such systems embed prediction power available for instance in both target identification or marker discovery or more generally for conducting inference about patients' pathological states, i.e. normal versus disease, diagnostic or prognostic analysis and preventive assessment, e.g. risk evaluation. The ultimate goal of personalized medicine will be achieved based on the confluence of the system's predictive power to patient-specific profiling.
