Overview

Before beginning this section review with your students the objectives listed in the Student Edition. This section explains Mendel's discoveries in modern terms and explains traits expressed as ratios.

Bellringer

Ask students to list on paper five characteristics that are passed on in families (eye, hair and skin color, height, and so on), and to name one characteristic that may also be inherited but that is also influenced by behavior or environment (muscle size, body weight, having a sun tan, and so on). **1** **Visual** **TAKS 2** **Basic**

Motivate

Demonstration

Basic

Display large pictures of a few flowering plants or bring in real plants. Ask students to come up with a list of traits that could be inherited in plants. Encourage students to think of many different traits, such as flower shape, flower color, flower position on stem, leaf shape, leaf color, pattern of veins, pattern of stem growth, presence of hairs on stems, and inner structure of flower. Ask them if they think the traits are inherited together or separately.

Objectives

- Identify the investigator whose studies formed the basis of modern genetics. **1** **Visual**
- List characteristics that make the garden pea a good subject for genetic study. **1** **Visual** **TAKS 2**
- Summarize the three major steps of Gregor Mendel's garden-pea experiments. **1** **Visual**
- Relate the ratios that Mendel observed in his crosses to his data. **1** **Visual**

Mendel's Studies of Traits

Many of your traits, including the color and shape of your eyes, the texture of your hair, and even your height and weight, resemble those of your parents. The passing of traits from parents to offspring is called **heredity**. Humans have long been interested in heredity. From the beginning of recorded history, we have attempted to alter crop plants and domestic animals to give them traits that are more useful to us. Before DNA and chromosomes were discovered, heredity was one of the greatest mysteries of science. **1**

Mendel's Breeding Experiments

The scientific study of heredity began more than a century ago with the work of an Austrian monk named Gregor Johann Mendel, shown in **Figure 1**. Mendel carried out experiments in which he bred different varieties of the garden pea *Pisum sativum*, shown in **Figure 2** and in **Table 1**. British farmers had performed similar breeding experiments more than 200 years earlier. But Mendel was the first to develop rules that accurately predict patterns of heredity. The patterns that Mendel discovered form the basis of **genetics**, the branch of biology that focuses on heredity. **1**

Mendel's parents were peasants, so he learned much about agriculture. This knowledge became invaluable later in his life. As a young man, Mendel studied theology and was ordained as a priest. Three years after being ordained, he went to the University of Vienna to study science and mathematics. There he learned how to study science through experimentation and how to use mathematics to explain natural phenomena. **1**

Mendel later repeated the experiments of a British farmer, T. A. Knight. Knight had crossed a variety of the garden pea that had purple flowers with a variety that had white flowers. (The term **cross** refers to the mating or breeding of two individuals.) All of the offspring of Knight's crosses had purple flowers. However, when two of the purple-flowered offspring were crossed, their offspring showed both white and purple flowers. The white trait had reappeared in the second generation!

Mendel's experiments differed from Knight's because Mendel counted the number of each kind of offspring and analyzed the data. **1**
