 Science* Tomasz Niedzielski,Krzysztof Migala,2017-09-09 This volume presents recent developments in atmospheric sciences  
 driven by numerical modeling which makes use of geospatial technologies and increasing computational power It gathers  
 examples of how geoinformatics supports meteorological climatological and water related studies One of the most important

features of geospatial technologies is that they provide methods and tools which may be utilized in real time or near real time in order to monitor and predict atmospheric processes This is particularly crucial in areas where dynamics of atmospheric phenomena is considerable and causes difficulties in accurate forecasting One of such areas is the transitional zone between oceanic and continental features of the mid latitude climate Good examples of investigations into the transitional zone come from Poland and its neighboring countries The topical volume provides the reader with a selection of papers on physically based and data based modelling of weather related phenomena over Poland This main theme of the topical volume is extended to cover case studies on the use of geoinformatics in atmospheric studies in other regions at a range of spatial scales
