Fletcher-Flinn,2015-09-28 Learning to read and to spell are two of the most important cultural skills that must be acquired by children and for that matter anyone learning a second language We are not born with an innate ability to read A reading system of mental representations that enables us to read must be formed in the brain Learning to read in alphabetic orthographies is the acquisition of such a system which links mental representations of visual symbols letters in print words with pre existing phonological sound and semantic comprehension cognitive systems for language Although spelling draws on the same representational knowledge base and is usually correlated with reading the acquisition processes involved are not quite the same Spelling requires the sequential production of letters in words and at beginning levels there may not be a full degree of integration of phonology with its representation by the orthography Reading on the other hand requires only the recognition of a word for pronunciation Hence spelling is more difficult than reading and learning to spell may necessitate more complete representations or more conscious access to them The learning processes that children use to acquire such cognitive systems in the brain and whether these same processes are universal across different languages and orthographies are central theoretical questions Most children learn to read and spell their language at the same time thus the co ordination of these two facets of literacy acquisition needs explication as well as the effect of different teaching approaches on acquisition Lack of progress in either reading and or spelling is also a major issue of concern for parents and teachers necessitating a cross disciplinary approach to the problem encompassing major efforts from researchers in neuroscience cognitive science experimental psychology and education The purpose of this Research Topic is to summarize and review what has been accomplished so far and to further explore these general issues Contributions from different perspectives are welcomed and could include theoretical computational and empirical works that focus on the acquisition of

Burke,2016-12-16 How making and sharing video games offer educational benefits for coding collaboration and creativity Over the last decade video games designed to teach academic content have multiplied Students can learn about Newtonian physics from a game or prep for entry into the army An emphasis on the instructionist approach to gaming however has overshadowed the constructionist approach in which students learn by designing their own games themselves In this book Yasmin Kafai and Quinn Burke discuss the educational benefits of constructionist gaming coding collaboration and creativity and the move from computational thinking toward computational participation Kafai and Burke point to recent developments that support a shift to game making from game playing including the game industry s acceptance and even promotion of modding and the growth of a DIY culture Kafai and Burke show that student designed games teach not only such technical skills as programming but also academic subjects Making games also teaches collaboration as students frequently work in teams to produce content and then share their games with in class or with others online Yet Kafai and Burke don t advocate abandoning instructionist for constructionist approaches Rather they argue for a more comprehensive inclusive idea of connected gaming in which both making and gaming play a part
