Tewari, 2012-12-06 Adsorption from aqueous solutions is important in many tech nological areas like water purification mineral beneficiation soil conservation detergency and many areas of biology Recently adsorption of radionuclides from aqueous solutions has become the focus of attention in assessing the movement of radionuclides through a geologic medium from underground radioactive waste repositor ies This volume provides a multidisciplinary overview of current work in the area of adsorption from aqueous solutions and reviews the progress that has been made in the theoretical models for assessing adsorption Adsorption of heavy metal ions and the effect of complex formation is treated extensively as are the effects of surface chemical properties of the adsorbent solution pH and thermodynamic parameters important in the adsorption process Adsorption of pesticides and organic polymeric species on different adsorbents are included and implications of adsorption of ions on dental materials are discussed Also included are studies of the adsorption of radionuclides by geologic media under environmental conditions The study of the chemical nature of the adsorbed species at the surface by X ray photoelectron spectro sc ope which often provides mechanistic information for the adsorption process is included for adsorbed metal ions on clay and mineral surfaces *Farmers' Review*, 1890 Plastid Proteostasis: Relevance of Transcription, Translation and Post-Translational Modifications Fiammetta Alagna, Michele Bellucci, Dario Leister, Andrea Pompa, 2017-12-28 Due to their bacterial endosymbiotic origin plastids are organelles with both nuclear encoded and plastid encoded proteins Therefore a highly integrated modulation of gene expression between the nucleus and the plastome is

needed in plant cell development Plastids have retained for the most part a prokaryotic gene expression machinery but differently from prokaryotes and eukaryotes they have largely abandoned transcriptional control and switched to predominantly translational control of their gene expression Some transcriptional regulation is known to occur but the coordinate expression between the nucleus and the plastome takes place mainly through translational regulation However the regulatory mechanisms of plastid gene expression PGE are mediated by intricate plastid nuclear interactions and are still far from being fully understood Although for example translational autoregulation mechanisms in algae have been described for subunits of heteromeric protein complexes and termed control by epistasy of synthesis CES only few autoregulatory proteins have been identified in plant plastids It should be noted of course that PGE in *C reinhardtii* is different from that in plants in many aspects Another example of investigation in this research area is to understand the interactions that occur during RNA binding between nucleus encoded RNA binding proteins and the respective RNA sequences and how this influences the translation initiation process In addition to this the plastid retains a whole series of mechanisms for the preservation of its protein balance proteostasis including specific proteases as well as molecular chaperones and enzymes useful in protein folding After synthesis plastid proteins must rapidly fold into stable three dimensional structures and often undergo co and posttranslational modifications to perform their biological mission avoiding aberrant folding aggregation and targeting with the help of molecular chaperones and proteases We believe that this topic is highly interesting for many research areas because the regulation of PGE is not only of wide interest for plant biologists but has also biotechnological implications Indeed plastid transformation turns out to be a very promising tool for the production of recombinant proteins in plants yet some limitations must still be overcome and we believe that this is mainly due to our limited knowledge of the mechanisms in plastids influencing the maintenance of proteostasis

Future Survey Annual 1992 Michael Marien,1993-01-30 *Abiotic Stresses in Field Crops: Response, Impacts and Management under Climate Change Scenario* Aliza Pradhan,Kamal Krishna Pal,Mahesh Kumar,Ashim Datta,Milan Kumar Lal,Md Khairul Alam,Basavaraj P. S.,2025-01-17 Agriculture is globally challenged by adverse environmental factors including drought heat waterlogging cold soil salinity and sodicity nutrient deficiency heavy metal contamination and other edaphic stresses These stresses impair plant functioning at multiple levels limiting plant development and crop productivity

In the current climate change scenario the increase in frequency and intensity of these stresses is posing a serious threat to overall food and nutrition security. Plants respond to these stresses through several tolerance mechanisms operating at molecular, biochemical, physiological or morpho-anatomical levels depending on their developmental stage and type of species. The cope up strategy also differs depending on abiotic stress type, duration and intensity. The extent to which these changes occur to counteract the impact of abiotic stresses as well as the pathways involved in plant acclimation is not fully understood. An advance in understanding agricultural crops adaptation and tolerance mechanisms underlying trans-generational effects, epigenetic changes and stress memory will significantly help in comprehending the implications as well as devising mitigation strategies for sustainable agriculture and thus food security. Additionally, it is crucial to understand the interactions and impacts of combined stresses to efficiently advance the development of combined stress tolerant crops as well as devising mitigation strategies for various climatic stressors.

Carbon Filtration for Reducing Emissions from Chemical Agent Incineration National Research Council, Division on Engineering and Physical Sciences, Commission on Engineering and Technical Systems, Committee on Review and Evaluation of the Army Chemical Stockpile Disposal Program, 1999-08-12. This report reviews the Army's evaluation of carbon filters for use in the baseline incineration PAS as well as the Army's change management process, the Army's tool for evaluating major equipment and operational changes to disposal facilities. In preparing this report, members of the Stockpile Committee evaluated exhaust gas emissions testing at the two operating baseline incineration systems, JACADS and the TOCDF, evaluated the development of the dilute SOPC carbon filter simulation model and evaluated the conceptual design of a modified PAS with an activated carbon filter. The two major risk assessments conducted for each continental disposal site that use the baseline system, namely 1) the quantitative risk assessment which evaluates the risks and consequences of accidental agent releases and 2) the health risk assessment which evaluates the potential effects of nonagent emissions on human health and the environment, were also examined.
