

Fig. 9.14 - Checking selector fork and sleeve (1971-74)

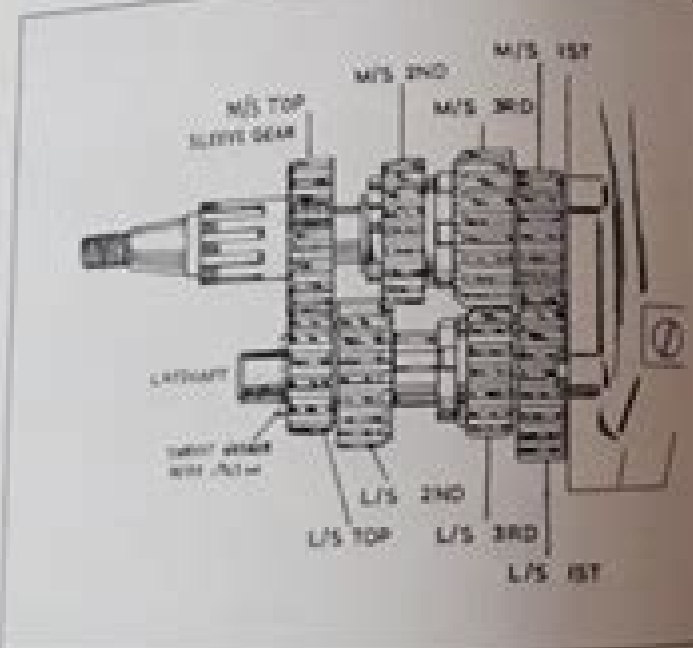

Fig. 9.15 - Gear change seen from the front

To adjust spring tension:

1. Fit the selector fork shaft into the hole in the camplate.
2. Fit a selector fork onto it.
3. Fit the spring assembly. Push the fork lightly to the reverse.

The aim is to adjust the position of the spring when the selector is in the reverse, such that there is minimal clearance between the edge of the spring and the selector fork and vertically, so that the push of the spring is to line with the selector fork when the spring is depressed as it will be when the cam plate pushes against it. Measure the spring with a finger to give you the check. When operated with the spring position, up for the reverse and check up the adjustment.

Fitting the (new) gear change spring (Fig. 9.16 and 9.17)

When fitted to the gear change shaft, a new spring should sit straight and be free, and should connect in line with the fork and the camplate. It should be in line with the fork.

How hard to actually fit and remove this spring? There is a lot of a trick to it. The part of the fork and push on the left - hard to describe, but it helps to get a wire-driven blade through the hole in the fork to push the spring.

There should also be no gap in the forkplate for the spring and the cam in the spring. If you are not happy with the fit of your new spring, take it back to the vendor and compare it with the original. If you are not happy, get a new one.
