State at room temperature:	gases, liquids or low-melting solids	Crystalline solids
Polarity:	Low	High
Solubility	Few are soluble in water; Many are soluble in organic liquids	Many are water soluble; Not soluble in organic liquids
Formation:	A covalent bond is formed between two non-metals that have similar electronegativities. Neither atom is "strong" enough to attract electrons from the other. For stabilization, they share their electrons from outer molecular orbit with others	An ionic bond is formed between a metal and a non-metal. Non-metals(-ve ion) are "stronger" than the metal(+ve ion) and can get electrons very easily from the metal. These two opposite ions attract each other and form the ionic bond.
Conductivity:	Do not conduct electricity	Conduct electricity when molten or dissolved in water
Melting point:	Low	High
What is it?:	Covalent bonding is a form of chemical bonding between two non metallic atoms which is characterized by the sharing of pairs of electrons between atoms and other covalent bonds.	Ionic bond, also known as electrovalent bond, is a type of bond formed from the electrostatic attraction between oppositely charged ions in a chemical compound. These kinds of bonds occur mainly between a metallic and a non metallic atom.

Examples:	Methane ( $\text{CH}_4$ ), Hydrochloric acid ( $\text{HCl}$ )	Sodium chloride ( $\text{NaCl}$ ), Sulfuric Acid ( $\text{H}_2\text{SO}_4$ )
Occurs between:	Two non-metals or a non-metal and a metalloid	One metal and one non-metal

**Reinforced Concrete and Masonry Structures** William Spaulding Kinne, 1924 **The Surveyor & Municipal & County Engineer**, 1926 Computational Methods for Reinforced Concrete Structures Ulrich Häußler-Combe, 2014-09-23 Das vorliegende Buch behandelt die Anwendung

numerischer Methoden auf die Berechnung von Stahlbetontragwerken Rissbildung Verbundwirkung und nichtlineares zeitabhängiges Spannungs-Dehnungs-Verhalten der Stahlbetonelemente lassen sich mit der Elastizitätstheorie allein nicht darstellen. Die Erfassung solcher Phänomene ist jedoch für die Untersuchung der Grenzzustände der Tragfähigkeit und der Gebrauchstauglichkeit erforderlich. Dieses Buch gibt eine anwendungsbezogene Zusammenfassung der numerischen Methoden einschließlich FEM. Der Schlüssel dazu liegt in der Beschreibung und im Verständnis des Materialverhaltens. Die wichtigsten Materialeigenschaften von Beton und Bewehrungsstahl und ihre Verbundwirkung werden erläutert. Mit diesen Grundlagen werden verschiedene Elemente wie Stäbe, Balken, Stabwerkmodell, Platten, Scheiben und Schalen behandelt. Dabei werden Vorspannung, Rissbildung, nichtlineares Spannungs-Dehnungs-Verhalten, Kriechen, Schwinden und Temperatureinwirkungen berücksichtigt. Für alle Tragelemente werden die jeweils geeigneten Methoden hergeleitet. Dynamische Aufgaben und quasi statische Kurzeiteinwirkungen sowie vorübergehende Prozesse wie Kriechen und Schwinden werden gelöst. Die Problemstellungen werden anhand von zahlreichen Beispielen veranschaulicht. Diese sind mit dem Programmpaket ConFem berechnet, welches zusammen mit den Eingabedaten unter Open Source Bedingungen unter [www.concrete-fem.com](http://www.concrete-fem.com) zur Verfügung steht. Der Autor zeigt die Möglichkeiten und Grenzen der numerischen Methoden der Baustatik zur Simulation von Stahlbetontragwerken auf. Ein Buch für Studium, Lehre und Forschung, ebenso wie für Tragwerksplaner und Ingenieure.

*Advances on bond in concrete* FIB - International Federation for Structural Concrete, 2022-12-01. Structural behavior of reinforced concrete elements strongly depends on the interaction between the reinforcing bars and the surrounding concrete, which is generally referred to as bond in concrete. In service conditions, the reinforcement-to-concrete bond governs deformability through the tension stiffening of concrete surrounding the bar, as well as the crack development and crack width. At Ultimate Limit State, bond governs anchorage and lap splices behavior, as well as structural ductility. When plain smooth bars were used, the steel-to-concrete bond was mainly associated with chemical adhesion and friction, that is related to the surface roughness of the rebar. As steel strengths increased, the need to enhance interaction between steel and the surrounding concrete was recognized, and square twisted rebars, indented rebars, or later on ribbed rebars, came into the market, the latter being the type of deformed bar most commonly adopted since the 1960-70s. When ribbed rebars became widely used, several research studies started worldwide for better understanding the interaction between ribs and the surrounding concrete. Researchers evidenced the development of micro cracks due to the wedge action of the ribs towards the external face of the structural element. If confinement is provided by the concrete cover by transverse reinforcement, or by an external transverse pressure, the full anchorage capacity is guaranteed and a pull-out failure occurs with crushing of concrete between the ribs. On the contrary, with lesser confining action, a splitting failure of bond occurs; the latter may provoke a brittle failure of the lap splice or, in some cases of anchorages. However, after many years of research studies on bond-related topics, there are still several open issues. In fact, new materials entered into the market as concrete

with recycled aggregates or fibre reinforced concrete the latter having a kind of distributed reinforcement into the matrix the fibres provides a better confinement to the wedge action of the ribs In addition concrete and steel strength continuously increased over the years causing changes in the bond behavior due to differences in mechanical properties of materials but also to the different concrete composition at the interface with the steel rebar causing a different bond behavior Moreover the lower water cement ratio of these high strength concrete makes the bleeding phenomena less evident changing the concrete porosity in the upper layers of the structural element and thus making the current casting position parameters no longer reliable Finally concrete with recycled aggregates are becoming more important in a market that is looking forward to a circular economy As such all the experimental results and database that allowed the calibration of bond rules now present in building codes for conventional concrete may be not be representative of these new types of materials nowadays adopted in practice Furthermore after more than 50 years of service life structural elements may not satisfy the current safety requirements for several reasons including material degradation with particular reference to steel corrosion or increased loads by also considering the seismic actions that were non considered by building codes at the time of the original design The structural assessment of existing structures requires proper conceptual models and new approaches for evaluating the reliability of existing structures by also considering the remaining expected service life In addition specific rules for older materials as plain smooth bars should be revised for a better assessment of old structures Last but not least interventions in existing structures may require new technologies now available such as post installed rebars While many advances have been achieved there remain areas where a better understanding of bond and its mechanisms are required and where further work is required to incorporate this understanding into safe and economic rules to guide construction and maintenance of existing infrastructures These aspects were widely discussed within the technical community particularly in the fib Task Group 2.5 and in the ACI 408 Committee dealing with bond and anchorage issues Furthermore special opportunities for discussing bond developments were represented by the International Conferences on Bond in Concrete held each decade since 1982 as well as by joint workshops organized by fib TG2.5 and ACI 408 Within this technical collaboration this Bulletin was conceived and thus it collects selected papers presented at the joint fib ACI Convention Session on Bond in Concrete held in Detroit USA in 2017 The bulletin is based on four main Sections concerning General aspects of bond Anchorages and laps of bars and prestressing tendons Bond under severe conditions Degradation of bond for corrosion Bond in new types of concrete The main aim of the Bulletin is to shed some new lights on the advances in understanding and application of bond related issues achieved over the last few years and identify the challenges and priorities to be addressed in the next years Another important aspect of the bulletin is to provide practical information from research findings
