Links Between Recombination and Replication Proceedings of the National Academy of Sciences, 2002-09-18

There has been a sea change in how we view genetic recombination When germ cells are produced in higher organisms genetic recombination assures the proper segregation of like chromosomes In the course of that process called meiosis recombination not only assures segregation of one chromosome of each type to progeny germ cells but also further shuffles the genetic deck contributing to the unique inheritance of individuals In a nutshell that is the classical view of recombination We have also known for many years that in bacteria recombination plays a role in horizontal gene transfer and in replication itself the latter by establishing some of the replication forks that are the structural scaffolds for copying DNA In recent years however we have become increasingly aware that replication which normally starts without any help from recombination is a vulnerable process that frequently leads to broken DNA The enzymes of recombination play a vital role in the repair of those breaks The recombination enzymes can function via several different pathways that mediate the repair of breaks as well as restoration of replication forks that are stalled by other kinds of damage to DNA Thus to the classical view of recombination as an engine of inheritance we must add the view of recombination as a vital housekeeping function that repairs breaks suffered in the course of replication We have also known for many years that genomic instability including mutations chromosomal rearrangements and aneuploidy is a hallmark of cancer cells Although genomic instability has many contributing causes including faulty replication there are many indications that recombination faulty or not contributes to genome instability and cancer as well The Nas colloquium *Links Between Recombination and Replication Vital Roles of Recombination* was convened to broaden awareness of this evolving area of research Papers generated by this colloquium are published here To encourage the desired interactions of specialists we invited some contributions that deal only with recombination or replication in addition to contributions on the central thesis of functional links between recombination and replication To aid the nonspecialist and specialist alike we open the set of papers with a historical overview by Michael Cox and we close the set with a commentary on the meeting and the field by Andrei Kuzminov

The methane moment - Cross-boundary significance of methanogens Zhe Lyu,Amelia-Elena Rotaru,Mark

Pimentel, Cuijing Zhang, Simon K.-M. R. Rittmann, 2024-07-30 Methane is a potent greenhouse gas a relatively clean burning fossil fuel but also a renewable biofuel when biologically produced from waste treatment plants Most 70% of the global methane emission comes from methanogenic archaea namely methanogens that produce methane from simple substrates such as H_2 CO_2 formate acetate methanol and other methylated compounds Methanogens are found across all corners of the earth including but not limited to wetlands animals and humans rice fields landfills sewage ocean termites and hydrothermal vents Their extensive adaptations to such a wide range of habitats predict a cross boundary significance of methanogens in many areas such as the environment energy agriculture biotechnology and human and animal health The goal of this Research Topic is to offer a forum that highlights the cross boundary significance of methanogens by bringing together methanogen research from diverse settings to one place This cross boundary significance is currently underappreciated but imperative to collectively understanding and helping to solve some of the biggest and most urgent challenges humanity is facing such as global warming food and energy insecurity pollution and disease As a more potent and shorter lived greenhouse gas than CO_2 methane has moved to the center stage in our efforts in rapidly combating climate change Presumably methanogens and their associated microbes may have been forced into a positive feedback loop to fuel the sharp rise of methane in recent years On the other hand methanogens are considered keystone species in the ecosystem which are vital to the stability of the natural biome therein However the roles of methanogens as keystone species across their habitats are underexplored Moreover the role of methanogens in human and animal intestinal microbiomes have been reconsidered with evidence for links to disease and impact on nutrition Last but not the least methanogens are emerging as a cell factory model for green manufacturing because of their abilities to convert CO_2 to valuable biochemicals Further efforts in the bioengineering of methanogens have the potential to expand their commercial application from waste treatment to biomanufacturing We welcome both basic and translational studies relevant to methanogens from any setting Studies with a focus on methanogens are highly encouraged and manuscripts having methanogens as a significant component are also welcome All studies should emphasize and envisage their implications in understanding and or solving one or more challenges humanity is facing To encourage submissions from multiple disciplines this Research Topic is cross listed with a number of Frontiers journals and sections Manuscripts in the forms of Original Research Review including systematic and mini review Methods Hypothesis and Theory and Perspectives are all welcome Manuscript summary submissions are highly encouraged but all manuscripts submitted prior to the manuscript submission deadline will receive full consideration This Research Topic is dedicated to Dr William Barny Whitman Emeritus Professor of Microbiology at the University of Georgia Athens GA His 40 years and still counting of productive research in methanogens roseobacter and other prokaryotes have contributed to and will continue to inspire new discoveries in the cross boundary significance of both archaea and bacteria the unseen majority COI Statement S K M R R is co founder of Arkeon GmbH M P is a consultant for Bausch Health Ferring

Ultrasocial John M. Gowdy,2021-08-26 Ultrasocial argues that rather than environmental destruction and extreme inequality being due to human nature they are the result of the adoption of agriculture by our ancestors Human economy has become an ultrasocial superorganism similar to an ant or termite colony with the requirements of superorganism taking precedence over the individuals within it Human society is now an autonomous highly integrated network of technologies institutions and belief systems dedicated to the expansion of economic production Recognizing this allows a radically new interpretation of free market and neoliberal ideology which far from advocating personal freedom leads to sacrificing the well being of individuals for the benefit of the global market Ultrasocial is a fascinating exploration of what this means for the future direction of the humanity can we forge a better more egalitarian and sustainable future by changing this socio economic and ultimately destructive path Gowdy explores how this might be achieved **Biogenic Wastes-Enabled**
