## Layers of the Atmosphere: An Exploration

The Earth's layers are vital to life. Understanding atmospheric phenomena, from weather to climate, is essential. This worksheet explores the layers of the atmosphere, their characteristics, and their importance to life on Earth.

**Troposphere:** The lowest layer of the atmosphere, extending from the surface to an altitude of about 10 kilometers (6.2 miles). It is the layer where most weather occurs. Temperature decreases with altitude in this layer.

**Stratosphere:** The second layer of the atmosphere, extending from the tropopause to an altitude of about 50 kilometers (31 miles). The temperature increases with altitude in this layer due to the absorption of ultraviolet radiation by ozone. The International Space Station orbits within this layer.

**Thermosphere:** The third layer of the atmosphere, extending from the mesopause to an altitude of about 600 kilometers (373 miles). The temperature increases with altitude in this layer due to the absorption of high-energy solar radiation. The aurora borealis and aurora australis occur in this layer.

**Exosphere:** The outermost layer of the Earth's atmosphere, extending from the top of the thermosphere to the edge of space. It is the layer where the atmosphere transitions into the vacuum of space.

**Diagram:** A cross-section of the Earth's atmosphere showing the layers and their boundaries. The layers are labeled: Troposphere, Stratosphere, Thermosphere, and Exosphere. The boundaries between the layers are labeled: Tropopause, Stratopause, and Mesopause. The diagram also shows the Earth's surface, the ozone layer, and the International Space Station orbiting in the Stratosphere.
