- What is chemical weathering?
- What factors affect the rate of weathering?

Vocabulary

- mechanical weathering
- frost wedging
- talus
- exfoliation
- chemical weathering

Earth's surface is constantly changing. Internal forces gradually raise some parts of the surface through mountain building and volcanic activity. At the same time, external processes continually break rock apart and move the debris to lower elevations, as shown in Figure 1. The breaking down and changing of rocks at or near Earth's surface is called weathering. Weathering is a basic part of the rock cycle and a key process in the Earth system. There are two types of weathering—mechanical and chemical. Though these processes are different, they are at work at the same time.

Figure 1 Weathering Ice, rain, and wind are slowly breaking down the rock in this mountain. The rock fragments accumulate in sloped deposits at the base of the mountain.

Mechanical Weathering

Mechanical weathering occurs when physical forces break rock into smaller and smaller pieces without changing the rock's mineral composition. Each piece has the same characteristics as the original rock. Breaking a rock into smaller pieces increases the total surface area of the rock. Look at Figure 2. When rock is broken apart, more surface area is exposed to chemical weathering. In nature, three physical processes are especially important causes of mechanical weathering: frost wedging, unloading, and biological activity.
