

## Thermoset Injection Mold Design Tips

When designing a mold for an injection molded part, it is important to keep in mind that the goal is to produce parts with the best quality, in as short a cycle as possible, with a minimum of scrap. To achieve this goal, you will need a mold that has a uniform mold temperature, balanced fill, and is properly vented.

### MOLD HEATING

A **uniform mold temperature** means that the temperature of each half of the mold is the same (within  $\pm 3^{\circ}\text{C}$  ( $5^{\circ}\text{F}$ )) for all locations when the mold is heated by oil or steam. Molds that are heated with electric cartridge heaters can vary by as much as  $6^{\circ}\text{C}$  ( $10^{\circ}\text{F}$ ). A mold with a uniform temperature will fill easier and produce parts with less warpage, improved dimensional stability and a uniform surface appearance. Achieving a uniform mold temperature is dependent on your method of mold heating.

A mold that is **heated by steam** or **oil** will have a uniform mold temperature because the heat source maintains a constant temperature. However, oil, as a heat source, is only about half as efficient as steam. Therefore, when using oil to heat a mold, it is necessary to set the oil temperature higher than the desired mold temperature.

**Electrically heated** molds are more difficult to maintain at a uniform temperature because the cartridge heaters are constantly cycling on and off. When they are on, they generate a great deal of heat at the source, but this heat must be distributed throughout the mold in a way that produces a uniform mold temperature.

To determine the amount of wattage needed to heat a mold, the use of the following formula might be helpful: **1¼ kilowatts for every 45 kg (100 pounds) of mold steel**. Note: This formula normally will allow the mold to be heated to molding temperatures in 1 to 2 hours.

Locating a heater on the centerline of the mold is not recommended, because the center of the mold is normally hot enough without adding any additional heat. Typically, the **cartridge heaters** are located in the support plates with a distance of 64 mm ( $2\frac{1}{2}$ " ) between heaters. **NOTE:** Deep draw molds may need to also have heaters in the retainer plate. There should be a minimum of one **thermocouple** to control each half of the mold. In larger molds, it is recommended to have more than one thermocouple in each mold half. This will result in better control and more uniform mold temperatures. The **thermocouples** should be located in the "A" and "B" plates, between two heaters if possible and at a distance of 32 mm - 38 mm ( $1\frac{1}{4}$ " -  $1\frac{1}{2}$ " ) from the closest cartridge heater. This distance is to be measured from the
