

14–87 Humid air is to be conditioned in a constant pressure process at 1 atm from 39°C dry bulb and 50 percent relative humidity to 17°C dry bulb and 10.8°C wet bulb. The air is first passed over cooling coils to remove all of the moisture necessary to achieve the final moisture content and then is passed over heating coils to achieve the final state.

- (a) Sketch the psychometric diagram for the process.
- (b) Determine the dew point temperature of the mixture at the inlet of the cooling coils and at the inlet of the heating coils.
- (c) What is the net heat transfer for the entire process for this process, in kJ/kg dry air?

Patent Office, 1886 Study on Fabrication and Performance of Metal-Supported Solid Oxide Fuel Cells Yucun Zhou, 2017-10-26 This book highlights the development of novel metal supported solid oxide fuel cells MS SOFCs. It describes the metal supported solid oxide fuel cells MS SOFCs that consist of a microporous stainless steel support nanoporous electrode composites and a thin ceramic electrolyte using the tape casting sintering infiltrating method. Further, it investigates the reaction kinetics of the fuel cells, electrodes structure performance relationship and degradation mechanism. By optimizing the electrode materials preparation process for the fuel cells and nano micro structure of the electrode, the resulting MS SOFCs demonstrated 1) great output power densities at low temperatures e.g. 1.02 W cm⁻² at 600 °C when operating in humidified hydrogen fuels and air oxidants; 2) excellent long term stability e.g. a degradation rate of 1.3% kh⁻¹ when measured at 650 °C and 0.9 A cm⁻² for 1500 h. The design presented offers a promising pathway for the development of low cost high power density and long term stable SOFCs for energy conversion.

Principles of Heating, Ventilation, and Air Conditioning in Buildings John W. Mitchell, James E. Braun, 2012-03-06 Principles of HVAC in Buildings by J. W. Mitchell and J. E. Braun provides foundational knowledge for the behavior and analysis of HVAC systems and related devices. The emphasis is on the application of engineering principles and features a tight integration of physical descriptions with a software program that allows performance to be directly calculated with results that provide insight into actual behavior. The examples, end of chapter problems and design projects are more than exercises; they represent situations that an engineer might face in practice and are selected to illustrate the complex and integrated nature of an HVAC system or piece of equipment. Coverage of material applicable to the field is broad: a Fundamentals section on thermodynamics, fluid flow, heat transfer and psychrometrics; types of HVAC systems and components; comfort and air quality criteria; a Loads section on weather data processing, design heating and cooling loads; an Equipment section on air and water distribution systems, heating and cooling coils, cooling towers, refrigeration equipment; and a Design and Control section on seasonal energy use control techniques, supervisory control, the HVAC design process and the rules of thumb often used in design. The textbook provides a foundation for students and practicing engineers to design HVAC systems for buildings. In addition, there is extensive supplemental online material that provides more in-depth and comprehensive treatment of equipment and component modeling and performance that is geared towards current and future equipment design engineers.
