Autoimmune Thyroid Pathology - Specificity of the Pediatric Age Malgorzata Gabriela Wasniewska, Aneta Monika Gawlik, Tommaso Aversa, 2021-03-10

The Aging Immune System and Health Valquiria Bueno, Rafael Solana, Annemieke Boots, 2020-01-15 The world population presents an increased percentage of individuals over 65 years old and the fastest growing subgroup is over 85 years old The increase in life expectancy observed in the last century has not been synonymous with extra years lived in good health disability free years Population studies have shown that as individuals age they can present a great heterogeneity of ability and health Therefore aging has been associated for some individuals with disabilities and hospitalizations Deaths related to infectious pathogens are increased in the aging population mainly due to pneumonia and influenza whereas Cytomegalovirus Epstein Barr virus among other viruses seem to contribute to the low grade inflammatory process observed inflammaging Aging is a complex and multifactorial process in which functions of the organism are adjusted remodelled in order to deal with damaging events during life One of the most important changes in aging individuals occurs in the immune system innate and adaptive responses with consequences such as poor response to new infections and vaccinations increased susceptibility to cancer development and autoimmune diseases frailty and organ dysfunction In addition it has been proposed that immunosenescence not only reflects the aging of the organism but also contributes to this process Bone marrow presents decreased hematopoiesis the thymus undergoes involution and lymphoid organs lymph nodes spleen also present reduced functionality Therefore cells derived matured or

residing in these tissues decline in number and function These changes have been identified in experimental models in vitro conditions peripheral blood and biopsies via biomarkers such as cell phenotype stimulus induced proliferation cytokines and antibodies levels Telomere length and telomerase activity also decline in bone marrow derived and peripheral blood cells and have been shown to play a role in immunosenescence More recently the investigation of short non coding RNA molecules microRNAs miRNAs pointed to this system as a possible control of aging related mechanisms Data obtained on these markers for aging individuals could lead to the generation of a marker panel for pathology prediction to indicate interventions and to evaluate the efficacy of interventions Interventions such as nutrition supplements exercise vaccination different dose concentration of antigen adjuvants have been proposed to circumvent age related diseases Considering the heterogeneity in the aging process further investigation is vital before the indication of interventions for aging individuals As the extension of life expectancy is a reality it is a challenge to understand how the aging population copes with the remodelling of the organism and how interventions could provide longevity in good health

*Understanding the Materno-Fetal Interface During Microbial Infections* Demba Sarr, Ricardo E. Fretes, Ulrike Kemmerling, Sodiomon B. Sirima, 2020-12-11 Pregnancy is a physiologically and immunologically challenging health state Immunological and physiological changes throughout the course of pregnancy make pregnant women usually susceptible to infection with microbial agents Infections with pathogens during pregnancy can have devastating consequences to both the fetus and his/her mother These infections are linked with adverse pregnancy outcomes Infections with parasites viruses or bacteria can be associated with maternal anemia abortion intrauterine growth retardation preterm delivery fetal morbidity and high risk of mortality during the first years of life Despite these significant consequences and complications associated with infections by microbial pathogens during the course of gestation very little is known about the underlying mechanisms of the pathogenesis and immunopathology of infections during pregnancy The Research Topic proposed here in will focus on microbial infections during pregnancy Studies and review papers addressing the pregnant host fetus pathogen interactions the host fetus immunological response against infections during gestation trans placental transfer of infections during pregnancy are welcome Topics related to model systems used to mirror the biology in human the pathogenesis and molecular pathways as well as the mechanisms of the disease at the maternofetal interface including the placenta the amniotic fluid and the fetal membranes will be considered making the scope and interest of the topic relatively broad There is a growing number of pathogens associated with pregnancy In most cases women are more susceptible to infections with these pathogens when they become pregnant in comparison to their non pregnant counterparts Unfortunately vertical transmission occurs in most cases but the underlying mechanisms are still unknown The placenta has always been

considered as a barrier against congenital infections but studies have indicated that microbial pathogens breach this barrier. The amniotic fluid and the fetal membranes are also important components of vertical transmission because of their non-sterile state even in most healthy pregnancies. During pregnancy, infections by malaria or toxoplasmosis as well as other viral or bacterial pathogens lead to an uncontrolled inflammatory response recognized as a significant cause for preterm delivery and intra-uterine growth retardation leading to low birth weight, a risk factor to infant morbidity and mortality. To successfully prevent, treat, eradicate or educate about microbial infections during pregnancy, we must understand the molecular mechanisms by which they cause poor birth outcomes including how vertical transmission occurs at the maternofetal interface. *Covid-19 and Diabetes* Susanna Hofmann, Hamad Ali, Mohamed Abu-Farha, 2022-07-14

The 2e of *Molecular Diagnostics*, the only book dealing with diagnosis on a molecular level, discusses current molecular biological techniques used to identify the underlying molecular defects in inherited disease. The book delves further into the principle and brief description of the technique followed by examples from the authors' own expertise. Contributors to the 2e are well-known experts in their field and derive from a variety of disciplines to ensure breadth and depth of coverage. *Molecular Diagnostics 2e* is a needed resource for graduate students, researchers, physicians and practicing scientists in molecular genetics and professionals from similar backgrounds working in diagnostic laboratories in academia or industry as well as academic institutions and hospital libraries.
