

Chapter 9-2 Genetic Crosses

Genotype and Phenotype

- An organism's genetic makeup is its genotype
- The genotype consists of the alleles that the organism inherits
 - The genotype is represented by Pp or PP
- An organism's physical appearance is its phenotype
 - The phenotype of a Pp or PP plant is purple flowers
- When both alleles of a pair are alike the organism is said to be homozygous (PP or pp)
- When both alleles of a pair are different the organism is said to be heterozygous (Pp)

Probability

- The likelihood that a specific even will occur
- Can be expressed in percentages, fractions, or ratios
- The results are more likely to occur when there are many trials

Monohybrid Crosses

- A cross between organisms in which only one characteristic is being tracked
- Punnett square is used to predict the probability of inherited traits
- Example 1: Homozygous x Homozygous
 - Cross between two true-breeding organisms (PP x pp)
 - All organisms have Pp genotype and exhibit the dominant allele
- Example 2: Homozygous x Heterozygous
 - Cross between PP and Pp
 - 50% probability of Pp offspring; 50% probability of PP offspring (this is with EACH gamete produced)
 - all offspring will exhibit the dominant allele
- Example 3: Heterozygous x Heterozygous
 - Cross between Pp and Pp
 - 25% probability of PP; 50% probability Pp; 25% probability pp
 - 75% of the offspring will exhibit the dominant allele; 25% will exhibit the recessive allele
- Example 4: Testcross
 - If you are unsure of an individuals genotype, you could perform a testcross with an individual of homozygous recessive genotype
 - If a recessive allele is expressed in any of the offspring, you would be able to identify that the unknown genotype would be heterozygous

Incomplete Dominance

- Occurs when the phenotype of a heterozygote is an intermediate between the phenotypes of the parents
- Ex: red flowers crossed with white flowers produce pink flowers

Physiological and Molecular Mechanisms of Important Agronomic Traits in Plants Under Various Abiotic Factors Dongmei Li,Dominik K.

Großkinsky ,Weiwei Zheng,Zhibo Wang,2024-10-30 Plants live in environments influenced by various abiotic factors that can cause diverse stresses for example because of low or high temperature deficient or excessive water high salinity heavy metals and ultraviolet radiation etc These abiotic stresses are hostile to plant growth and development leading to great fruit quality and crop yield penalties worldwide especially under the global climate change Facing the numerous abiotic stresses plants have developed strategies to protect themselves in evolution The elucidation of their effects and underlying mechanisms is of great significance as a fundamental principle to relieve the pressure of environmental changes and to meet the demand of human population growth Up to date scientific efforts are welcome to be delivered into this topic for a comprehensive understanding of the physiological and molecular effects of diverse abiotic stresses on plants ranging from model species to economically important crops The newly identified and characterized mechanisms and genetics associated with plant adaptability to abiotic stress will provide novel insights into the physiological and molecular alterations of plants under abiotic stresses It will assist in understanding plants behavior adapting to the environmental change and perspective agricultural practice including crop breeding and field management and eventually help maintain the food security safety and sustainability In addition increasing evidence shows that the recent advancements and developments of plant biotechnologies and application of big data to the area of plant science promote the understanding of the physiological and molecular effects of diverse abiotic stresses on plants Hence the investigations integrated by multidisciplinary approaches are strongly encouraged including but not limited to CRISPR Cas mediated gene editing functional genomics phenomics and high
